## Legal information

### Warning concept

This manual contains information which you must observe to ensure your personal safety as well as to avoid material damage. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to equipment damage have no safety alert symbol. Depending on the hazard level, warnings are indicated in a descending order as follows.

 <b>DANGER</b>
indicates that death or serious injury <b>will</b> result if proper precautions are not taken.
 <b>WARNING</b>
indicates that death or serious injury <b>could</b> result if proper precautions are not taken.
 <b>CAUTION</b>
indicates that minor personal injury can result if proper precautions are not taken.
<b>NOTICE</b>
indicates that property damage can result if proper precautions are not taken.

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A warning notice with a safety alert symbol warning of injury may also include a warning relating to property damage.

### Qualified personnel

The product/system described in this documentation may only be operated by **personnel qualified** for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of siemens products

Note the following:

 <b>WARNING</b>
Siemens products are only permitted to be used for the applications listed in the catalog and in the associated technical documentation. If third-party products and components are to be used, they must be recommended or approved by Siemens. These products can only function correctly and safely if they are transported, stored, set up, mounted, installed, commissioned, operated and maintained correctly. The permissible ambient conditions must be met. Information in the associated documentation must be observed.

### Trademarks

All names identified with ® are registered trademarks of Siemens AG. Any other names used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of liability

We have checked the contents of this publication for consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. The information given in this document is reviewed at regular intervals and any corrections that might be necessary are made in the subsequent editions.

# Preface

## SINAMICS documentation

The SINAMICS documentation is organized in the following categories:

- General documentation/catalogs
- User documentation
- Manufacturer/service documentation

## More information

Information on the topics is available under the link  
<http://www.siemens.com/motioncontrol/docu>:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (finding and searching in manuals/information)

Please send any questions about the technical documentation (e.g. suggestions for improvement, corrections) to the following e-mail address  
([docu.motioncontrol@siemens.com](mailto:docu.motioncontrol@siemens.com)).

## My Documentation Manager

At the following address (<http://www.siemens.com/mdm>), you can find information on how to create your own individual documentation based on Siemens' content, and adapt it for your own machine documentation.

## Training

At the following address (<http://www.siemens.com/sitrain>), you can find information about SITRAIN (Siemens training on products, systems and solutions for automation and drives).

## FAQs

You can find Frequently Asked Questions in the Service&Support pages under Product Support (<http://support.automation.siemens.com>)

## SINAMICS

You can find information on SINAMICS at the following address

### Target group

This documentation is intended for machine manufacturers, commissioning engineers, and service personnel who use the SINAMICS drive system.

### Benefit

This manual provides all of the information, procedures and operator actions required for the particular usage phase.

### Standard scope

The scope of the functionality described in this document can differ from the scope of the functionality of the drive system that is actually supplied.

- Other functions not described in this documentation might be able to be executed in the drive system. However, no claim can be made regarding the availability of these functions when the equipment is first supplied or in the event of service.
- The documentation can also contain descriptions of functions that are not available in a particular product version of the drive system. The functionalities of the supplied drive system should only be taken from the ordering documentation.
- Extensions or changes made by the machine manufacturer must be documented by the machine manufacturer.

For reasons of clarity, this documentation does not contain all of the detailed information on all of the product types and cannot take into consideration every conceivable type of installation, operation and service/maintenance.

## Technical Support

You will find phone numbers for other countries for technical support in the Internet in the "Contact" area at the following address (<http://www.siemens.com/automation/service&support>).

## EC Declaration of Conformity, certificates, certifications, manufacturers declarations

You can find the EC Declaration of Conformity for the relevant directives as well as the relevant certificates, prototype test certificates, manufacturers declarations and test certificates for functions relating to functional safety ("Safety Integrated") in the Internet at the following address (<http://support.automation.siemens.com/WW/view/de/21901735/134200>).

You can obtain an up-to-date list of currently certified components on request from your local Siemens office. If you have any questions relating to certifications that have not yet been completed, please ask your Siemens contact person.

---

### Note

You can find certificates for the North American market on the Internet page of the certifier:

- For products with UL-certificate (<http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.html>)
  - For products with TÜV SÜD certificate ([https://www.tuev-sued.de/industry\\_and\\_consumer\\_products/certificates](https://www.tuev-sued.de/industry_and_consumer_products/certificates))
  - For products with CSA-certificate (<http://www.csagroup.org/de/en/services/testing-and-certification/certified-product-listing>)
- 

## Notation

The following notation and abbreviations are used in this documentation:

### Notation for faults and alarms (examples):

- F12345            Fault 12345
- A67890            Alarm 67890
- C23456            Safety message

### Notation for parameters (examples):

- p0918            Adjustable parameter 918
- r1024            Display parameter 1024
- p1070[1]        Adjustable parameter 1070, index 1
- p2098[1].3      Adjustable parameter 2098, index 1 bit 3
- p0099[0...3]    Adjustable parameter 99, indices 0 to 3
- r0945[2](3)     Display parameter 945, index 2 of drive object 3
- p0795.4         Adjustable parameter 795, bit 4

1.1	General safety instructions	12
1.2	Industrial security	13

## 1.1 General safety instructions

 <b>WARNING</b>
<b>Risk of death if the safety instructions and remaining risks are not carefully observed</b>
If the safety instructions and residual risks are not carefully observed in the associated hardware documentation, accidents involving severe injuries or death can occur.
<ul style="list-style-type: none"><li>• Observe the safety instructions given in the hardware documentation.</li><li>• When assessing the risk, take into account residual risks.</li></ul>

 <b>WARNING</b>
<b>Danger to life or malfunctions of the machine as a result of incorrect or changed parameter assignment</b>
Machines can malfunction as a result of incorrect or changed parameter assignment, which in turn can lead to injuries or death.
<ul style="list-style-type: none"><li>• Protect the parameterization (parameter assignments) against unauthorized access.</li><li>• Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY-STOP or EMERGENCY-OFF).</li></ul>

## 1.2 Industrial security

---

### Note

#### Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, devices, and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

To ensure that Siemens products and solutions are operated securely, suitable preventive measures (e.g. cell protection concept) and each component must be integrated into a state-of-the-art holistic industrial security concept. Any third-party products that may be in use must also be taken into account. You will find more information about industrial security at:

<http://www.siemens.com/industrialsecurity>

To receive information about product updates on a regular basis, register for our product newsletter. You will find more information at:

<http://support.automation.siemens.com>

---

### WARNING

#### Danger due to unsafe operating states caused by software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can result in death, severe injuries and/or material damage.

- Update your software regularly.

You can find information and newsletters on this subject at:

<http://support.automation.siemens.com>

- Integrate the automation and drive components into a holistic, state-of-the-art industrial security concept for the plant or machine.

For more information, visit:

<http://www.siemens.com/industrialsecurity>

- Make sure that you include all installed products into the holistic industrial security concept.

## 2.1 Overview of parameters

### 2.1.1 Explanation of the parameter list

#### Basic structure of parameter descriptions

The data in the following example has been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The "List of parameters" (Page 33) has the following structure:

----- **Start of example** -----

<b>pxxxx[0...n]</b>	<b>BICO: Full parameter name / abbreviated name</b>			
Drive object (function module)	<b>Can be changed:</b> C1(x), C2(x), U, T	<b>Calculated:</b> CALC_MOD_REG	<b>Access level:</b> 2

<b>Note:</b>	Information which might be useful			

----- **End of example** -----

The individual pieces of information are described in detail below.

**pxxxx[0...n]      Parameter number**

The parameter number is made up of a "p" or "r", followed by the parameter number and the index (optional).

Examples of the representation in the parameter list:

- p...                      Adjustable parameters (read and write parameters)
- r...                      Display parameters (read only)
- p0918                    Adjustable parameter 918
- p0099[0...3]          Adjustable parameter 99, indices 0 to 3
- p1001[0...n]          Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944                    Display parameter 944
- r2129.0...15          Display parameter 2129 with bit field from bit 0 (smallest bit) to bit 15 (largest bit)

Other examples of the notation in the documentation:

- p1070[1]                Adjustable parameter 1070, index 1
- p2098[1].3             Adjustable parameter 2098, index 1 bit 3
- r0945[2](3)            Display parameter 945, index 2 of drive object 3
- p0795.4                Adjustable parameter 795, bit 4

The following applies to adjustable parameters:

The parameter value "when shipped" is specified under "Factory setting" with the relevant unit in square parentheses. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions or parameters:

- Executing macros  
p0015, p0700, p1000, p1500
- Setting the PROFIBUS telegram (BICO interconnection)  
p0922
- Setting component lists  
p0230, p0300, p0301, p0400
- Automatically calculating and pre-assigning  
p0340, p0578, p3900
- Restoring the factory settings  
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square parentheses.

---

#### Note

The parameter list can contain parameters that are not visible in the expert lists of the particular commissioning software (e.g. parameters for trace functions).

---

#### BICO: Full parameter name / abbreviated name

The following abbreviations can appear in front of the parameter name:

- BI: Binector Input  
This parameter is used for selecting the source of a digital signal.
- BO: Binector Output  
This parameter is available as a digital signal for interconnection with other parameters.
- CI: Connector Input  
This parameter is used for selecting the source of an "analog" signal.
- CO: Connector Output  
This parameter is available as an "analog" signal for interconnection with other parameters.
- CO/BO: Connector/Binector Output  
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

---

#### Note

A connector input (CI) cannot be interconnected with any connector output (CO, signal source).

When interconnecting a connector input using the commissioning software, only the signal sources that are actually possible are listed.

---

#### Drive object (function module)

A drive object (DO) is an independent, "self-contained" functional unit that has its own parameters and, in some cases, faults and alarms.

When carrying out commissioning using the commissioning software, you can select/deselect additional functions and their parameters by activating/deactivating function modules accordingly.

---

#### Note

---

The parameter list specifies the associated drive object and function module for each individual parameter.

Example:

- p1070 CI: Main setpoint  
SERVO\_S110 (ext setp)  
This parameter is available only for the SERVO\_S110 drive object in conjunction with the "Extended setpoint channel" function module.

A parameter can belong to one, several, or all drive objects.

The following information relating to "Drive object" and "Function module" can be displayed under the parameter number:

Table 2-1 Data in the "Drive object (function module)" field

Drive object (function module)	Type	Meaning
All objects	-	This parameter is used by all drive objects.
CU	-	Control Unit, all versions.
CU_S110-CAN	1	SINAMICS S110 Control Unit with CAN interface.
CU_S110-DP	1	SINAMICS S110 Control Unit with PROFIBUS DP interface.
CU_S110-PN	1	SINAMICS S110 Control Unit with PROFINET interface.
SERVO_S110-CAN SERVO_S110-DP SERVO_S110-PN	11	S110 servo drive.
SERVO_S110-CAN (pos ctrl) SERVO_S110-DP (pos ctrl) SERVO_S110-PN (pos ctrl)	-	SINAMICS S110 servo drive with "Position control" function module (r0108.3).
SERVO_S110-CAN (EPOS) SERVO_S110-DP (EPOS) SERVO_S110-PN (EPOS)	-	SINAMICS S110 servo drive with "Basic positioner" function module (r0108.4).
SERVO_S110-CAN (extend. setp) SERVO_S110-DP (extend. setp) SERVO_S110-PN (extend. setp)	-	SINAMICS S110 servo drive with "Extended setpoint channel" function module (r0108.8).
SERVO_S110-CAN (Safety rotary) SERVO_S110-DP (Safety rotary) SERVO_S110-PN (Safety rotary)	-	SINAMICS S110 servo drive with "Safety rotary axis" function module (r0108.13).
SERVO_S110-CAN (ext. brake) SERVO_S110-DP (ext. brake) SERVO_S110-PN (ext. brake)	-	SINAMICS S110 servo drive with "Extended brake control" function module (r0108.14).
SERVO_S110-CAN (techn_ctrl) SERVO_S110-DP (techn_ctrl) SERVO_S110-PN (techn_ctrl)	-	SINAMICS S110 servo drive with "Technology controller" function module (r0108.16).
SERVO_S110-CAN (ext. msg) SERVO_S110-DP (ext. msg) SERVO_S110-PN (ext. msg)	-	SINAMICS S110 servo drive with "Extended messages/monitoring functions" function module (r0108.17).
SERVO_S110-CAN (FBLOCKS) SERVO_S110-DP (FBLOCKS) SERVO_S110-PN (FBLOCKS)	-	SINAMICS S110 servo drive with "Free function blocks" function module (r0108.18).

#### Note

The drive object type is used to identify the drive objects in the drive system (e. g. r0107, r0975[1]).

### Can be changed

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C1(x), C2(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive unit state and that the change will not take effect until the unit switches to another state. This can be a single state or multiple states.

The following states are available:

- C1(x) Device commissioning C1: Commissioning 1  
Device is being commissioned (p0009 > 0).  
Pulses cannot be enabled.  
The parameter can only be changed for the following device commissioning settings (p0009 > 0):
  - C1: Can be changed for all settings p0009 > 0.
  - C1(x): Can be changed only when p0009 = x.A modified parameter value does not take effect until the device commissioning mode is exited with p0009 = 0.
- C2(x) Drive object commissioning C2: Commissioning 2  
Drive commissioning is in progress (p0009 = 0 and p0010 > 0).  
Pulses cannot be enabled.  
The parameter can only be changed in the following drive commissioning settings (p0010 > 0):
  - C2: Can be changed for all settings p0010 > 0.
  - C2(x): Can only be changed for the settings p0010 = x.A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.
- U Operation U: Run  
Pulses are enabled.
- T Ready T: Ready to run  
The pulses are not enabled and the state "C1(x)" or "C2(x)" is not active.

---

#### Note

Parameter p0009 is CU-specific (belongs to the Control Unit).

Parameter p0010 is drive-specific (belongs to each drive object).

The operating state of individual drive objects is displayed in r0002.

---

## Calculated

Specifies whether the parameter is influenced by automatic calculations.

The calculation attribute defines which activities influence the parameter.

The following attributes apply:

- CALC\_MOD\_ALL
  - p0340 = 1
  - Project download with commissioning software and send from p0340 = 3
- CALC\_MOD\_CON
  - p0340 = 1, 3, 4
- CALC\_MOD\_EQU
  - p0340 = 1, 2
- CALC\_MOD\_LIM\_REF
  - p0340 = 1, 3, 5
  - p0578 = 1
- CALC\_MOD\_REG
  - p0340 = 1, 3

---

### Note

For p3900 > 0, p0340 = 1 is also called automatically.

After p1910 = 1, p0340 = 3 is also automatically called.

---

## Access level

Specifies the minimum access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard
- 2: Extended
- 3: Expert
- 4: Service

Parameters with this access level are password protected.

---

### Note

Parameter p0003 is CU-specific (belongs to the Control Unit).

A higher access level will also include the functions of the lower levels.

---

**Data type**

The information on the data type can consist of the following two items (separated by a slash):

- First item  
Data type of the parameter.
- Second item (for binector or connector input only)  
Data type of the signal source to be interconnected (binector/connector output).

Parameters can have the following data types:

- Integer8                    I8            8-bit integer number
- Integer16                  I16           16-bit integer number
- Integer32                  I32           32-bit integer number
- Unsigned8                  U8            8 bits without sign
- Unsigned16                U16           16 bits without sign
- Unsigned32                U32           32 bits without sign
- FloatingPoint32          Float        32-bit floating point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when creating BICO interconnections:

Table 2-2 Possible combinations of BICO interconnections

BICO output parameter	BICO input parameter			
	CI parameter			BI parameter

## Dynamic index

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

The following information can be contained in this field:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)
- "MDS, p0130" (Motor Data Set, MDS count)
- "PDS, p0120" (Power unit Data Set, PDS count)

## Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

### Example:

Function block diagram:    3060:    Function block diagram number  
3060.3

3:    Signal path (optional)

## P-Group (only when accessing via BOP (Basic Operator Panel))

Specifies the functional group to which this parameter belongs. The required parameter group can be set via p0004.

---

### Note

Parameter p0004 is CU-specific (belongs to the Control Unit).

---

### Unit, unit group and unit selection

The standard unit of a parameter is specified in square parentheses after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched over, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be changed over.

#### Example:

Unit group: 7\_1, unit selection: p0505

The parameter belongs to unit group 7\_1 and the unit can be changed over using p0505.

#### Note

Detailed information on changing over units can be found in the following references:

References: /FH3/ SINAMICS S110 Function Manual Drive Functions

All the potential unit groups and possible unit selections are listed below.

Unit group	Unit selection for p0595 =		Reference variable for %
	Value	Unit	
9_1	The values that can be set and the technological units are shown in p0595.		

**Parameter values**

- Min Minimum value of the parameter [unit]
  - Max Maximum value of the parameter [unit]
  - Factory setting Value when delivered [unit]
- In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0].
- A different value may be displayed for certain parameters (e.g. p1800) at the initial commissioning stage or when establishing the factory settings.
- Reason:  
The setting of these parameters is determined by the operating environment of the Control Unit (e.g. depending on converter type, macro, power unit).

**Not for motor type**

Specifies for which motor type this parameter has no significance.

- Ind. motor : Asynchronous Motor
- PMSM : Permanent-magnetized-excited synchronous motor
- REL : Reluctance motor textiles / SIEMOSYN motor
- SESM : Separately-excited synchronous motor

## Normalization

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100 %

## Expert list

Specifies whether this parameter is available in the expert list of the specified drive objects in the commissioning software.

1: Parameter exists in the expert list.

0: Parameter does not exist in the expert list.

NOTICE
Users are responsible for using parameters that are marked "Expert list: 0" (parameter not included in the expert list).
These parameters and their functionalities have not been tested and no further user documentation is available for them (e. g. description of functions). Moreover, "Technical Support" (hotline) does not provide any support for these parameters.

## Description

Explanation of a parameter function.

## Values

Lists the possible values of a parameter

## Recommendation

Information about recommended settings.

#### Index

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) of indexed adjustable parameters:

- Min, Max:

The adjustment range and unit apply to all indices.

- Factory setting:

When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.

When the indices have different factory settings, they are all listed individually with the unit.

#### Bit field

For parameters with bit fields, the following information is provided about each bit:

- Bit number and signal name
- Meaning for signal states 0 and 1
- Function block diagram (optional)

The signal is shown on this function diagram.

#### Dependency

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

See also: List of other parameters to be additionally considered.

## 2.1.2 Number ranges of parameters

### Note

The following number ranges represent an overview for all the parameters available for the SINAMICS drive family.

The parameters for the product described in this List Manual are described in detail in "List of parameters" (Page 33).

Parameters are grouped into the following number ranges:

Table 2-7 Number ranges for SINAMICS

**Description:** Sets the access level for reading and writing parameters via the Basic Operator Panel (BOP).

**Value:** 1: Standard  
 2: Extended  
 3: Expert  
 4: Service

**Note:** Access level 0 (user-defined):  
 Parameters from the user-defined list (p0013). Not used as of firmware version 2.6 (p0016).  
 Access level 1 (standard):  
 Parameters for the simplest operator control possibility (e.g. p1120 = ramp-function generator, ramp-up time).  
 Access level 2 (extended):  
 Parameters to operate the basic functions of the drive unit.  
 Access level 3 (experts):  
 Expert know-how is required for these parameters (e.g. BICO parameterization).  
 Access level 4 (service):  
 For these parameters, it is necessary that authorized service personnel enter the appropriate password (p3950).

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	65535	[0] 2 [1] 0

**Description:** Sets the parameter number and parameter index for display for p0006 = 2, 4 for the Basic Operator Panel (BOP).  
 Examples for the SERVO drive object:  
 p0005[0] = 21, p0005[1] = 0: Actual speed smoothed (r0021)  
 p0005[0] = 25, p0005[1] = 0: Output voltage smoothed (r0025)

**Index:** [0] = Parameter number  
 [1] = Parameter index

**Dependency:** Refer to: p0006

**Note:** Procedure:

1.  
The parameter number to be displayed should be set in index 0. Only the monitoring parameters (read-only parameters) can be set that actually exist for the actual drive object.  
If the set parameter number is not indexed, or if there is an index in index 1 that lies outside the valid range of the set parameter, then index 1 is automatically set to 0.
2.  
The index that belongs to the parameter set in index 0 should be set in index 1. The permissible changes in index 1 always depend on the parameter number set in index 0.

	0	149	1
<b>Description:</b>	Sets the device and basic drive commissioning. By appropriately setting this parameter, those parameters are filtered that can be written into in the various commissioning steps.		
<b>Value:</b>	0: Ready 1: Device configuration 2: Defining the drive type/function module 3: Drive base configuration 4: Data set base configuration 29: Device download 30: Parameter reset 115: Parameter download 129: Only Siemens int 149: Only Siemens int		
<b>Note:</b>	The drives can only be powered up outside the device commissioning (the inverter enabled). In this case, p0009 must be 0 (Ready) and the individual drive objects must have already gone into operation (p0010). p0009 = 1: Device configuration At the first commissioning of the device, after booting, the device is in the "device configuration" state. To start the internal automatic first commissioning of the drive unit, p0009 should be set to 0 (Ready) after the ID for the actual topology (r0098) was transferred into the ID for the target topology (p0099). To do this, it is sufficient to set a single index value of p0099[x] the same as r0098[x]. Before the device has been completely commissioned, no other parameter can be changed. After the first commissioning was carried out, in this state, when required, other basic device configuration parameters can be adapted (e.g. the basic sampling time in p0110). p0009 = 2: Defines the drive type / function module In this state, the drive object types and/or the function modules can be changed or selected for the individual drive objects. To do this, the drive object type can be set using p0107[0...15] and the function can be set using p0108[0...15] (refer to p0101[0...15]). p0009 = 3: Drive basic configuration In this state, after the device has been commissioned for the first time, basic changes can be made for the individual drive objects (e.g. sampling times in p0111, p0112, p0115 and the number of data sets in p0120, p0130, p0140, p0170, p0180). p0009 = 4: Data set basic configuration In this state, after the device has been commissioned for the first time, for the individual drive objects changes can be made regarding the assignment of the components (p0121, p0131, p0141, p0151, p0161) to the individual data sets and the assignment of the power unit, motor and encoder to the drive data sets (p0185, ...). p0009 = 29: Device download If a download is made using the commissioning software, the device is automatically brought into this state. After the download has been completed, p0009 is automatically set to 0 (ready). It is not possible to manually set p0009 to this value.		

p0009 = 30: Parameter reset

In order to bring the complete unit into the "first commissioning" state or to load the parameters saved using p0977, to start, p0009 must be set to this value. p0976 can then be changed to the required value.

p0009 = 115: Parameter download

This state allows the complete device and drive commissioning using the parameter services.

<b>Description:</b>	Sets the parameter filter to commission a drive. Setting this parameter filters out the parameters that can be written into in the various commissioning steps.		
<b>Value:</b>	0: Ready 1: Quick commissioning 2: Power unit commissioning 3: Motor commissioning 4: Encoder commissioning 5: Technological application/units 15: Data sets 17: Basic positioner commissioning 25: Position control commissioning 29: Only Siemens int 30: Parameter reset 95: Safety Integrated commissioning 10000: Ready with immediate feedback signal		
<b>Notice:</b>	For p0010 = 10000 the following applies: It is not possible to modify parameters after changing the value.		
<b>Note:</b>	The drive can only be powered up outside the drive commissioning (inverter enable). To realize this, this parameter must be set to 0. By setting p3900 to a value other than 0, the quick commissioning is completed, and this parameter is automatically reset to 0. Procedure for "Reset parameter": Set p0010 to 30 and p0970 to 1. p0010 = 10000 corresponds to p0010 = 0. Unlike with p0010 = 0, the parameter modification is applied immediately and the calculations are made in the background. Further parameter modifications cannot be made while the calculations are being performed.

	- [%]	- [%]	- [%]

**Description:** Displays the smoothed torque utilization as a percentage.

The torque utilization is obtained from the required smoothed torque in reference to the torque limit, scaled using p2196.

**Note:** Smoothing time constant = 100 ms  
The signal is not suitable as a process quantity and may only be used as a display quantity.

The torque utilization is available smoothed (r0033) and unsmoothed (r0081).

For M\_set total (r0079) > M\_max offset (p1532), the following applies:

- demanded torque = M\_set total - M\_max offset
- actual torque limit = M\_max upper effective (r1538) - M\_max offset

For M\_set total (r0079) <= M\_max offset (p1532), the following applies:

- demanded torque = M\_max offset - M\_set total
- actual torque limit = M\_max offset - M\_max lower effective (r1539)

For the actual torque limit = 0, the following applies: r0033 = 100 %

For the actual torque limit < 0, the following applies: r0033 = 0 %

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [%]	- [%]	- [%]

**Description:** Displays the motor utilization from the thermal I2t motor model.

**Dependency:** The motor utilization is only determined for permanent-magnet synchronous motors and if the I2t motor model is activated.

The motor utilization is formed from the ratio between the I2t motor model temperature (minus 40 Kelvin) and the reference value p0605 (motor overtemperature, fault threshold) - 40 Kelvin. If p0605 is reduced, r0034 increases and the motor temperature remains the same.

Refer to: p0611, p0612, p0615

**Note:** Smoothing time constant = 100 ms  
 The signal is not suitable as a process quantity and may only be used as a display quantity.  
 A value of r0034 = -200.0 % indicates an invalid display, for example, because the thermal I2t motor model was not activated or was incorrectly parameterized.

For r0035 equal to -200.0 °C, the following applies: - this temperature display is not valid (temperature sensor error). - A PTC sensor or bimetallic NC contact is connected. - the temperature sensor of the synchronous motor is de-activated (p0600 = 0 or p0601 = 0).

<b>Description:</b>	Displays the power unit overload determined using the I2t calculation. A current reference value is defined for the I2t monitoring of the power unit. It represents the current that can be conducted by the power unit without any influence of the switching losses (e.g. the continuously permissible current of the capacitors, inductances, busbars, etc.). If the I2t reference current of the power unit is not exceeded, then an overload (0 %) is not displayed. In the other case, the degree of thermal overload is calculated, whereby 100% results in a trip.

**Dependency:**

Refer to: r0002

**Note:**

The value r0046 = 0 indicates that all enable signals for this drive are present.

Bit 00 = 1 (enable signal missing), if:

- the signal source in p0840 is a 0 signal.
- there is a "switching on inhibited".

Bit 01 = 1 (enable signal missing), if:

- the signal source in p0844 or p0845 is a 0 signal.

Bit 02 = 1 (enable signal missing), if:

- the signal source in p0848 or p0849 is a 0 signal.

Bit 03 = 1 (enable signal missing), if:

- the signal source in p0852 is a 0 signal.

Bit 04 = 1 (armature short-circuit active), if:

- the signal source in p1230 has a 1 signal

Bit 05, Bit 06: Being prepared

Bit 08 = 1 (enable signal missing), if:

- the pulse enable via terminal EP is missing (booksize: X21, chassis: X41).

Bit 09 = 1 (enable signal missing), if:

- the signal source in p0864 is a 0 signal.

Bit 10 = 1 (enable signal missing), if:

- the signal source in p1140 is a 0 signal.

Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:

- the signal source in p1141 is a 0 signal.
- the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.

Bit 12 = 1 (enable signal missing), if:

- the signal source in p1142 is a 0 signal.
- When activating the function module "basic positioner" (r0108.4 = 1), the signal source in p1142 is set to a 0 signal.

Bit 16 = 1 (enable signal missing), if:

- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.

## 2 Parameters

### 2.2 List of parameters

- Bit 17 = 1 (enable signal missing), if:
- commissioning mode is selected (p0009 > 0 or p0010 > 0).
  - there is an OFF2 fault response.
  - the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- Bit 18 = 1 (enable signal missing), if:
- OFF3 has still not been completed or an OFF3 fault response is present.
- Bit 19 = 1 (internal pulse enable missing), if:
- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.
- Bit 20 = 1 (internal armature short-circuit active), if:
- the drive is not in the state "S4: Operation" or "S5x" (refer to function diagram 2610).
  - the internal pulse enable is missing (r0046.19 = 0).
- Bit 21 = 1 (enable signal missing), if:
- The pulses have been enabled and the speed setpoint has still not been enabled, because:
- the holding brake opening time (p1216) has still not expired.
  - the motor has still not been magnetized (induction motor).
  - the encoder has not been calibrated (U/f vector and synchronous motor)
- Bit 22: Being prepared
- Bit 26 = 1 (enable signal missing), if:
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- Bit 27 = 1 (enable signal missing), if:
- de-magnetizing has still not been completed (only for vector).
- Bit 28 = 1 (enable signal missing), if:
- the holding brake is closed or has still not been opened.
- Bit 29 = 1 (enable signal missing), if:
- the cooling unit ready signal via BI: p0266[1] missing.
- Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:
- A 0 signal is available via BI: p0856.
  - the function generator with current input is active.
  - the measuring function "current controller reference frequency characteristic" is active.
  - the pole position identification is active.
  - motor data identification is active (only certain steps).
- Bit 31 = 1 (enable signal missing), if:
- the speed setpoint from jog 1 or 2 is entered.

<b>Description:</b>	Setting to pre-assign/check the sampling times for the internal controller clock cycles for clock-synchronous PROFIdrive operation. p0092 = 1: The controller clock cycles are set so that clock synchronous PROFIdrive operation is possible. If it is not possible to change the controller clock cycles of the clock-cycle synchronous PROFIdrive operation, then an appropriate message is output. The pre-setting of the controller clock cycles can result in a derating of the Motor Module (e.g. p0115[0] = 400 µs --> 375 µs). When the drive unit utilization (r9976) is calculated, its maximum computing time load has already been calculated during ramp-up for clock-cycle synchronous operation and taken into account in r9976 (V4.3 and higher), if fixed DCC run-time groups "Receive AFTER IF1 PROFIdrive PZD" and "Send BEFORE IF1 PROFIdrive PZD" are used. p0092 = 0: The controller clock cycles are set without any restrictions by the clock-cycle PROFIdrive operation (as for up to version V2.3). When the drive unit utilization (r9976) is calculated, its maximum computing time load has already been calculated during ramp-up for non-clock-cycle-synchronous operation and taken into account in r9976 (V4.3 and higher), if fixed DCC run-time groups "Receive AFTER IF1 PROFIdrive PZD" and "Send BEFORE IF1 PROFIdrive PZD" are used.		
<b>Value:</b>	0: No isochronous PROFIBUS 1: Isochronous PROFIBUS		
<b>Dependency:</b>	Refer to: p0115 Refer to: A01224		
<b>Caution:</b>	Only current controller clock cycles (p0115[0]) which are integers of 125 µs are permitted for isochronous mode. In addition, current controller clock cycles 31.25 µs and 62.5 µs are possible.		
			
<b>Notice:</b>	p0092 only affects the automatic default for the clock cycles (p0115) in the drive. If the clock cycles are modified subsequently in expert mode (p0112 = 0), p0092 = 0 should be set so that the new values are not overwritten again by the automatic default when the parameters are downloaded. The conditions for current controller clock cycle for isosynchronous operation must still be carefully ensured (refer under Caution!).

## 2 Parameters

### 2.2 List of parameters

**Notice:** When the pole position angle (r0093) is output via test socket Tx (x = 0, 1, 2) to adjust the encoder (to determine the angular commutation offset) the test socket being used must be parameterized as follows:

p0771[x] = r0093  
 p0777[x] = 0 %  
 p0778[x] = 0 V  
 p0779[x] = 400 %  
 p0780[x] = 4 V  
 p0783[x] = 0 V  
 p0784[x] = 0

For p1821 = 1 (counter-clockwise direction of rotation) the following applies:

In order to adjust the encoder using the EMF method, the value, determined using the oscilloscope, must be inverted and then entered in p0431.

**Note:** For operation with encoder and pulse suppression, the following applies:

- the value is generated from r0094 + 180 °.
- this angle can be used to adjust the encoders of synchronous motors.

For pulse enable, the following applies:

- the value indicates the transformation angle used by the control + 180 °.
- this value is, contrary to r0094, also applicable (provides information) for encoderless operation and after a pole position identification routine.

**Description:** Setting to activate/de-activate an encoder interface (Sensor Module).

**Value:**  
0: De-activate component  
1: Activate component  
2: Component de-activate and not present

**Recommendation:** After inserting a component, before activating, first wait for Alarm A01317.

**Dependency:**  
Refer to: r0146  
Refer to: A01314, A01317

**Note:** The de-activation of an encoder interface corresponds to the "parking encoder" function and has the same effect. The activation of a component can be rejected if the component was inserted for the first time. In this case, it is only possible to activate the component when the pulses for all of the drive objects are inhibited. With the encoder interface for encoder 1 (motor encoder), the relevant drive object for writing the parameter must be in the "Ready for operation" state. With the encoder interface for encoders 2 and 3, the parameter can also be written during operation. Re value = 0, 2:  
When a component is deactivated it no longer outputs any errors.  
If value = 0:  
The component was completely commissioned and is deactivated using this value. It can be removed from the DRIVE-CLiQ without any error.  
If value = 1:  
The component must be available for error-free operation.  
If value = 2:  
A component in a project generated offline and set to this value must never be inserted in the actual topology from the very start.  
For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

## 2 Parameters

### 2.2 List of parameters

**Notice:** This information represents the characteristics/features of the power unit firmware. It does not provide information/data about the characteristics/features of the hardware (e.g. bit 06 = 1 means that although the firmware supports "liquid cooling", a power unit with liquid cooling does not have to be used).

**Note:** Re bit 09:

The Motor Module supports the internal armature short-circuit. The function is internally required for voltage protection (p1231 = 3).

Re bit 10:

The Motor Module supports the autonomous internal voltage protection. If the voltage protection function is internally activated (p1231 = 3) the Motor Module decides autonomously - using the DC link voltage - as to whether the short-circuit is activated.

Re bit 23:

The component supports the detection of current actual values (and the detection of valve close durations) with double clocking and phase shift.

<b>Description:</b>	Sets the actual code number from r0200 to acknowledge the power unit being used. When commissioned for the first time, the code number is automatically transferred from r0200 into p0201.		
<b>Dependency:</b>	Refer to: F07815		
<b>Notice:</b>	When p0201 = 10000, the rated power unit data is reloaded and dependent parameters are set (e.g. p0205, p0210, p0230, p0857, p1800). p0201 is then automatically assigned the value of r0200 if the code number of the power unit could be read. A warm start must be performed after this procedure (automatically if necessary).		

## 2 Parameters

### 2.2 List of parameters

**Note:** The parameter is used to identify when the drive is being commissioned for the first time.  
The power unit commissioning can only be exited (p0201 = r0200), if the actual and acknowledged code numbers are identical (p0010 = 2). However, if the comparator in p9906 or p9908 is at 2 (low) or 3 (minimum), the power unit commissioning is automatically set to p0201 = r0200 upon exiting.  
When the code number is changed, the connection voltage (p0210) is checked and, if necessary, adjusted.  
For parallel circuit configurations, the parameter index is assigned to a power unit.

<b>Dependency:</b>	Set p1254, p1294 (automatic detection of the Vdc switch-on levels) = 0. The switch-in thresholds of the Vdc_max controller are then directly determined using p0210.		
<b>Caution:</b>	If the line supply voltage is higher than the entered value, the Vdc controller may be automatically de-activated in some cases to prevent the motor from accelerating. In this case, an appropriate alarm is output.		
<b>Note:</b>	Setting ranges for p0210 as a function of the rated power unit voltage: U <sub>rated</sub> = 400 V: - p0210 = 380 ... 480 V (AC/AC), 510 ... 720 V (DC/AC) U <sub>rated</sub> = 500 V: - p0210 = 500 ... 600 V (AC/AC), 675 ... 900 V (DC/AC) U <sub>rated</sub> = 660 V ... 690 V: - p0210 = 660 ... 690 V (AC/AC), 890 ... 1035 V (DC/AC) U <sub>rated</sub> = 500 V ... 690 V: - p0210 = 500 ... 690 V (AC/AC), 675 ... 1035 V (DC/AC)		

The pre-charging switch-in threshold for the DC link voltage (Vdc) is calculated from p0210:

$$V_{dc\_pre} = p0210 * 0.82 * 1.35 \text{ (AC/AC)}$$

$$V_{dc\_pre} = p0210 * 0.82 \text{ (DC/AC)}$$

The undervoltage thresholds for the DC link voltage (Vdc) are calculated from p0210 as a function of the rated power unit voltage:

$$U_{rated} = 400 \text{ V:}$$

$$- U_{min} = p0210 * 0.78 \text{ (AC/AC)} > 330 \text{ V, } p0210 * 0.60 \text{ (DC/AC)} > 380 \text{ V}$$

$$U_{rated} = 500 \text{ V:}$$

$$- U_{min} = p0210 * 0.76 \text{ (AC/AC)} > 410 \text{ V}$$

$$U_{rated} = 660 \text{ V ... } 690 \text{ V:}$$

$$- U_{min} = p0210 * 0.82 \text{ (AC/AC)} > 565 \text{ V, } p0210 * 0.63 \text{ (DC/AC)} > 650 \text{ V}$$

$$U_{rated} = 500 \text{ V ... } 690 \text{ V:}$$

$$- U_{min} = p0210 * 0.82 \text{ (AC/AC)} > 420 \text{ V, } p0210 * 0.63 \text{ (DC/AC)} > 480 \text{ V}$$

## 2 Parameters

### 2.2 List of parameters

The setting is made as a percentage of the maximum power unit current (r0209).  
**Index:** [0] = Threshold at which pre-charging starts  
[1] = Threshold at which pre-charging stops

**Dependency:** Refer to: F30021

**Note:** The parameter only applies to booksize and chassis power units.

De-activating the ground fault monitoring:

- Sequence: --> p0287[1] = 0 --> p0287[0] = 0

- irrespective of the firmware version of the power unit.

Sets the thresholds:

- the prerequisite is at least firmware version 2.2 of the power unit.

**Description:**

Sets the response to a thermal overload condition of the power unit.

The following quantities can result in a response to thermal overload:

- heat sink temperature (r0037.0)

- chip temperature (r0037.1)

- power unit overload I2T (r0036)

Possible measures to avoid thermal overload:

- reduce the output current limit r0289 and r0067 (for closed-loop speed/velocity or torque/force control) or the output frequency (for U/f control) indirectly via the output current limit and the intervention of the current limiting controller).

- reduce the pulse frequency (only for vector control).

A reduction, if parameterized, is always realized after an appropriate alarm is output.

**Value:**

0: Reduce output current or output frequency

1: No reduction shutdown when overload threshold is reached

2: Reduce I\_output or f\_output and f\_pulse (not using I2t)

3: Reduce the pulse frequency (not using I2t)

**Dependency:**

If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only responses can be selected without pulse frequency reduction (p0290 = 0, 1).

If a fault or alarm is present, then r2135.13 or r2135.15 is set.

Refer to: r0036, r0037, p0108, r0108, r2135

Refer to: A05000, A05001, A07805

**Caution:**

If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.

**Note:**

The setting p0290 = 0, 2 is only practical if the load decreases with decreasing speed (e.g. for applications with variable torque such as for pumps and fans).

Under overload conditions, the current and torque limit are reduced, and therefore the motor is braked and forbidden speed ranges (e.g. minimum speed p1080 and suppression [skip] speeds p1091 ... p1094) can be passed through.

For p0290 = 2, 3, the I2t overload detection of the power unit does not influence the responses.

When the motor data identification routine is selected, p0290 cannot be changed.

<b>Description:</b>	Selects the motor type or start to read in the motor parameters for a motor with DRIVE-CLiQ (p0300 = 10000). For p0300 < 10000 the following applies: The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list: 1 = Rotating induction motor 2 = Rotating synchronous motor The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/AOP).		
<b>Value:</b>	0: No motor 1: Induction motor (rotating) 2: Synchronous motor (rotating, permanent-magnet) 104: 1PH4 induction motor 107: 1PH7 induction motor 108: 1PH8 induction motor 111: Induction motor (rotary) for OEMs 200: 1PH8 synchronous motor 206: 1FT6 synchronous motor 207: 1FT7 synchronous motor 222: Synchronous motor (rotary) for OEMs 231: 1FG1 synchronous motor 236: 1FK6 synchronous motor 237: 1FK7 synchronous motor 444: Synchronous motor (linear) for OEMs 10000: Motor with DRIVE-CLiQ 10001: Motor with DRIVE-CLiQ 2nd data set		
<b>Dependency:</b>	When the motor type is changed, the code number in p0301 may be reset to 0. If p0300 is changed during quick commissioning (p0010 = 1), then the matching technological application (p0500) is automatically pre-assigned. This does not occur when commissioning the motor (p0010 = 3). If p0300 = 10000 is written for a parameter download, p0500 is pre-assigned with DRIVE-CLiQ corresponding to the motor type. Refer to: p0301		
<b>Caution:</b>	If a catalog motor is selected (p0300 >= 100) and an associated motor code number (p0301), then the parameters that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 2 for p0301 = 2xxxx). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters. The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assignment (if the particular motor type is listed): Type/code number ranges 102 / 102xx, 112xx, 122xx 104 / 104xx, 114xx, 124xx 107 / 107xx, 117xx, 127xx 108 / 108xx, 118xx, 128xx 134 / 134xx, 144xx, 154xx 136 / 136xx, 146xx, 156xx 166 / 166xx, 176xx, 186xx 200 / 200xx, 210xx, 220xx 204 / 204xx, 214xx, 224xx 206 / 206xx, 216xx, 226xx 207 / 207xx, 217xx, 227xx 261 / 261xx, 262xx		

283 / 283xx, 293xx  
 286 / 286xx, 296xx  
 403 / 403xx, 413xx  
 406 / 406xx, 416xx, 426xx

- Notice:** If required, the list of motor codes/encoder codes can be found in the Appendix of the List Manual.
- Note:** With p0300 = 10000, for a motor with DRIVE-CLiQ, the motor parameters are automatically downloaded, with p0300 = 10001, the motor parameters of a second data set (if available).  
 If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited.  
 A motor type with a value above p0300 >= 100 describes motors for which a motor parameter list exists.  
 Motor types with a value below p0300 < 100 correspond to the selection of a third-party motor. When appropriately selected, this means that the motor parameters are pre-assigned the settings for a third-party motor.  
 This also applies for parameters for a motor with DRIVE-CLiQ. In this case p0300 can only be set to p0300 = 10000 or 10001 (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number) in order to be able to cancel the write protection.

<b>Notice:</b>	If required, the list of motor codes/encoder codes can be found in the Appendix of the List Manual.		
<b>Note:</b>	The motor code number can only be changed if the matching catalog motor was first selected in p0300. For a motor with DRIVE-CLiQ, p0301 cannot be changed. In this case, p0301 is automatically written to the code number of the motor parameter read in (r0302) if p0300 is set to 10000. When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected. If, for direct drives, the motor code number (p0301) is changed, this does not automatically result in the angular commutation offset being determined (p0431).

<b>Description:</b>	Displays the motor code number from the saved motor data from a motor with DRIVE-CLiQ.		
<b>Note:</b>	Drive commissioning can only be exited if the code number that was downloaded (r0302) matches the stored code number (p0301). If the numbers differ, then the motor data set should be re-loaded using p0300 = 10000. The motor data are always expected from the first encoder that is assigned to the drive data sets (refer to p0187 = encoder 1) data set number. The value is not updated cyclically but only on specific events (e.g. update DRIVE-CLiQ device). r0302 = 0: No motor with DRIVE-CLiQ found

<b>Notice:</b>	If p0310 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).		
<b>Note:</b>	For synchronous motors, the parameter is not required and must therefore be pre-assigned zero. For p0310 = 0, it is not possible to calculate the pole pair; instead, it must be entered in p0314.

<b>Description:</b>	Sets the motor pole pair number.		

p0314 = 1: 2-pole motor

p0314 = 2: 4-pole motor, etc.

**Dependency:**

For p0314 = 0, the pole pair number is automatically calculated from the rated frequency (p0310) and the rated speed (p0311) and displayed in r0313.

**Notice:**

If p0314 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).

For induction motors, the value need only be input if the rated data of a generator is entered therefore resulting in a negative rated slip. In this case, the number of pole pairs in r0313 is too low by 1 and must be manually corrected.

<b>Value:</b>	0: Non-ventilated 1: Forced cooling 2: Liquid cooling 4: Non-ventilated and internal fan 5: Forced cooling and internal fan 6: Liquid cooling and internal fan 128: No fan		
<b>Dependency:</b>	For 1LA5 and 1LA7 motors (refer to p0300), the parameter is pre-set as a function of p0307 and p0311.		
<b>Caution:</b>	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
<b>Note:</b>	The parameter influences the thermal 3-mass motor model. 1LA1 and 1LA8 motors are characterized by the fact that they have an internal rotor fan. This "internal cooling" lies within the motor frame and is not visible. Air is not directly exchanged with the motor ambient air. For 1PQ8 motors, p0335 should be set to 5 as these motors are force-ventilated motors. 1LA7 motors, frame size 56 are operated without fan.

- Notice:** It is not possible to modify parameters after changing the value.  
The following parameters are influenced using p0340:  
The parameters designated with (\*) are not overwritten for catalog motors (p0300 > 100).
- p0340 = 1:

--> p1461 (for p0348 > p0322, p1461 is set to 100 %)  
--> p1463 (for p0348 > p0322, p1463 is set to 400 %)
- p0340 = 5:  
--> p1037, p1038, p1520, p1521, p1530, p1531, p2140 ... p2142, p2148, p2150, p2155, p2161, p2162, p2163, p2164, p2175, p2177, p2194, p3820 ... p3829
- Note:** p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5 without overwriting the motor parameters from the Siemens motor lists (p0301 > 0).  
p0340 = 2 calculates the motor parameters (p0350 ... p0360), but only if it does involve a Siemens catalog motor (p0301 = 0).  
p0340 = 3 contains the calculations of p0340 = 4, 5.  
p0340 = 4 only calculates the controller parameters.  
p0340 = 5 only calculates the controller limits.  
When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.  
At the end of the calculations, p0340 is automatically set to 0.  
If the STARTER commissioning software writes a 3 into p0340 when "downloading to target device", then this corresponds to a "complete calculation of the motor/control parameters without equivalent circuit diagram data". The same calculations are carried out as for p0340 = 1, however, without the equivalent circuit diagram parameters of the motor (p0340 = 2), the motor moment of inertia (p0341) and the motor weight (p0344).

<b>Note:</b>	The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). if this time is shortened too much, then this can result in an inadequate de-magnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating).

<b>Note:</b>	The reference parameter for resistances of the rated motor impedance $Z = p0304 / (1.732 * p0305)$ is in the % units system. Inductances are converted into a resistance using the factor $2 * \text{Pi} * p0310$ . If a reference parameter (p0304, p0305, p0310) is zero, then it is not possible to make a changeover to "referred" values (per unit values).

<b>Description:</b>	Resistance of the power cable between the Motor Module and motor.		
<b>Caution:</b>	The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which p0352 was changed must be subtracted from the stator resistance p0350 or motor data identification must be repeated.		
			
<b>Note:</b>	The parameter influences the temperature adaptation of the stator resistance. The motor identification routine does not change the cable resistance. This is subtracted from the total measured stator resistance in order to calculate the stator resistance (p0350, p0352). The cable resistance is reset when quick commissioning is exited with p3900 > 0.

<b>Caution:</b>	An encoder type with p0400 < 9000 defines an encoder for which there is an encoder parameter list. When selecting a catalog encoder (p0400 < 9000) the parameters from the encoder parameter list cannot be changed (write protection). To remove write protection, the encoder type should be set to a third-party encoder (p0400 = 9999).		
<b>Notice:</b>	If required, the list of motor codes/encoder codes can be found in the Appendix of the List Manual.		

**Note:** The connected encoder can be identified by setting p0400 to 10000 or 10100. This assumes that the encoder supports this method, which is possible in the following cases: Motor with DRIVE-CLiQ, encoder with EnDat interface, DRIVE-CLiQ encoder.

The encoder data (e.g. pulse number p0408) can only be changed when p0400 = 9999.

When using an encoder with track A/B and zero pulse, as standard, fine synchronization is not set using a zero mark. If, for a synchronous motor, fine synchronization is to be realized using a zero mark, then the following must be executed:

- set p0400 to 9999
- set p0404.15 to 1

Prerequisite:

Coarse synchronization must be selected (e.g. pole position identification) and the zero pulse of the encoder must be either mechanically or electronically (p0431) adjusted to the pole position.

For p0400 = 10000 the following applies:

If an identification is not possible, then p0400 is set to 0.

For p0400 = 10100 the following applies:

If an identification is not possible, p0400 remains set to 10100 until it becomes possible.

For p0400 = 9000, 9001 the following applies:

- for p0400 = 9000 and p0184 > 0 the following BICO interconnection is established: Cl: p2530 = CO: r2531
- for p0400 = 9001 and p0184 > 0 the following BICO interconnection is established: Cl: p1155 = CO: r0061
- write protection for the parameters from the encoder parameter list is lifted
- check the encoder parameters and make any necessary corrections

**Description:** Selects the encoder from the list of encoder types that the OEM supports.

**Note:** The connected encoder can be identified by p0400 = 10000. This means that the encoder must support this and is possible in the following cases: Motor with DRIVE-CLiQ, encoder with EnDat interface.

If an identification is not possible, then p0400 is set to 0.

The encoder data (e.g. pulse number p0408) can only be changed when p0400 = 9999.

Using p0400 = 20000, the encoder type can be selected from the list of OEM encoders using p0401.

### 2.2 List of parameters

12	Equidistant zero mark	Yes	No	-
13	Irregular zero mark	Yes	No	-
14	Distance-coded zero mark	Yes	No	-
15	Commutation with zero mark (not ASM)	Yes	No	-
16	Acceleration	Yes	No	-
17	Track A/B analog	Yes	No	-
20	Voltage level 5 V	Yes	No	-
21	Voltage level 24 V	Yes	No	-
22	Remote sense (only SMC30)	Yes	No	-
23	Resolver excit	Yes	No	-

**Caution:** This parameter is automatically pre-set for encoders from the encoder list (p0400).  
When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Notice:** If an SSI encoder (bit 9 = 1) is used as motor encoder for permanent-magnet synchronous motors, then this is only permissible in conjunction with an additional A/B track (bit 3 = 1 or bit 4 = 1).

**Note:** ZM: Zero mark  
SMC: Sensor Module Cabinet

If a technique to determine the commutation information/data has not been selected (e.g. track C/D, Hall sensor), and the encoder pulse number is an integer multiple of the pole number, then the following applies:  
The track A/B is adjusted to match the magnetic position of the motor.

Re bit 01, 02 (absolute encoder, multiturn encoder):  
These bits can only be selected for EnDat encoders, SSI encoders or DRIVE-CLiQ encoders.

Re bit 10 (DRIVE-CLiQ encoder):  
This bit is only used for the large-scale integrated DRIVE-CLiQ encoders that provide their encoder data directly in DRIVE-CLiQ format without converting this data. This bit is not, therefore, set for first-generation DRIVE-CLiQ encoders.

Re bit 12 (equidistant zero mark):  
The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).  
The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.

Re bit 13 (irregular zero mark):  
The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.

Re bit 14 (distance-coded zero mark):  
The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.

Re bit 15 (commutation with zero mark):  
Only applicable for synchronous motors.  
The function can be de-selected by priority via p0430.23.  
For distance-coded zero marks, the following applies:  
The phase sequence of the C/D track (if available) must be the same as the phase sequence of the encoder (A/B track).  
The phase sequence of the Hall signal (if available) must be the same as the phase sequence of the motor. Further, the position of the Hall sensor must be mechanically adjusted to the motor EMF.  
The fine synchronization is only started after two zero marks have been passed.

**Caution:** This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** Re bit 02:  
When the function is activated, track monitoring can be de-activated by setting p0437.26.  
Re bit 05:  
When the function is activated, a frequency setpoint and a direction for traveling can be entered via an encoder interface.

<b>Description:</b>	Sets the fine resolution in bits of the incremental position actual values.		
<b>Note:</b>	The parameter applies for the following process data: - Gx_XIST1 - Gx_XIST2 for reference mark or flying measurement The fine resolution specifies the fraction between encoder pulses. Depending on the physical measurement principle, an encoder pulse can be broken down into a different number of fractions (e.g. squarewave encoder: 2 bit = resolution 4, sin/cos encoder: Typical 11 bit = resolution 2048). For a squarewave encoder, with the factory setting, the least significant bits have the value zero, i.e. they do not supply any useful information. For especially high quality measuring systems, the fine resolution must be increased corresponding to the available accuracy.

<b>Notice:</b>	A bit-wise configuration is only possible if the corresponding property is also present in r0458.				

- Note:**
- Re bit 17 (burst oversampling):
    - if bit = 1, burst oversampling is switched on.
  - Re bit 18 (continuous oversampling):
    - if bit = 1, continuous oversampling is switched on.
  - Re bit 19 (Safety position actual value sensing):
    - if bit = 1, the Safety position actual value is transferred in the cyclic telegram.
  - Re bit 20 (speed calculation mode):
    - if bit = 1, the speed is calculated via incremental difference without extrapolation.
    - if bit = 0, the speed is calculated via edge time measurement with extrapolation. p0453 is effective in this mode.
  - Re bit 21 (zero mark tolerance):
    - if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does.
  - Re bit 22 (rotor position adaptation):
    - if bit = 1, the rotor position is corrected automatically. The correction speed is +/-1/4 encoder pulse per zero mark distance.
  - Re bit 23 (de-select commutation with zero mark):
    - The bit should only be set for encoders that have not been adjusted.
  - Re bit 24 (commutation with selected zero mark):
    - if bit = 1, the commutation position is corrected via a selected zero mark.
  - Re bit 25 (disconnect the encoder power supply on parking):
    - if bit = 1, the encoder power supply is switched off on parking (0 V).
    - if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.
  - Re bit 27 (extrapolate position values):
    - if bit = 1, the extrapolation of the position values is activated.
  - Re bit 28 (cubic correction):
    - if bit = 1, the cubic correction for track A/B sine is activated.
  - Re bit 29 (phase correction):
    - if bit = 1, the phase correction for track A/B sine is activated.
  - Re bit 30 (amplitude correction):
    - if bit = 1, the amplitude correction for track A/B sine is activated.
  - Re bit 31 (offset correction):
    - if bit = 1, the offset correction for track A/B sine is activated.

p0431[0...n]	Angular commutation offset / Ang_com offset

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-180.00 [°]	180.00 [°]	0.00 [°]

**Description:** Sets the angular commutation offset.

**Dependency:** The value is taken into account in r0094.  
Refer to: r0094, r1778

**Caution:** When the firmware is upgraded from V2.3 to V2.4 or higher, the value must be reduced by 60° if all the following conditions are fulfilled:

- The motor is a synchronous motor (p0300 = 2, 2xx, 4, 4xx).
- The encoder is a resolver (p0404.23 = 1).
- The actual speed value is inverted (p0410.0 = 1).

**Notice:** The angular commutation offset cannot be generally taken from other drive systems. As a minimum - the sign of the offset determined for SIMODRIVE 611 digital and SIMODRIVE 611 universal must be reversed for SINAMICS (p0431 (SINAMICS) = -p1016 (SIMODRIVE)).

**Note:** Angular commutation offset, angular difference between electrical position of encoder and flux position.  
For p0404.5 = 1 (track C/D) the following applies:  
The angular offset in p0431 acts on track A/B, the zero mark on track C/D.

07	Accumulate uncorrected encoder pulses	Yes	No	-
11	Fault handling after PROFIdrive	Yes	No	-
12	Activate additional messages	Yes	No	-
26	Track monitoring de-selection	Yes	No	-
28	EnDat linear encoder monitoring incremental/absolute	Yes	No	-
29	EnDat encoder initialization with high accuracy	Yes	No	-
31	Analog unipolar track monitoring	Yes	No	-

**Dependency:**

Refer to: p0430, r0459

**Note:**

A value of zero is displayed if an encoder is not present.

Re bit 00:

When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.

Re bit 01:

If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.

For bit = 1, the zero mark is evaluated depending on the direction of rotation detected. For a positive direction of rotation, the positive edge of the zero mark is considered and for a negative direction of rotation, the negative edge of the zero mark.

Re bit 02:

If the bit is set, in the event of a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulses per revolution are corrected. If the bit is not set, encoder fault F3x131 is triggered.

Re Bit 04 and Bit 05:

The actual hardware only supports 1x or 4x signal evaluation.

Bit 5/4 = 0/0: Signal evaluation per period, 4x.

Bit 5/4 = 1/0: Illegal setting.

Bit 5/4 = 0/1: Signal evaluation per period, 1x.

Bit 5/4 = 1/1: Illegal setting.

Re bit 06:

If the function is active, when dn/dt monitoring responds, the speed actual value is internally frozen for a time equivalent to two current controller clock cycles. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.

Re bit 07:

If the bit is set, the encoder pulses which have not been corrected are added to p4688 at the zero mark.

Re bit 11:

If the bit is set, the Sensor Module checks within a certain time grid whether the fault cause is still present. This enables the Sensor Module to switch from the fault state to the operating state and provide valid actual values automatically. The faults are displayed until the user acknowledges them.

Re bit 12:

Additional fault messages can be activated for extended fault diagnostics.

Re bit 20:

If the bit is set, the bandwidth of the analog filter for SMx10 (resolver) and SMx20 (sin/cos encoder) can be set via p4660.

Re bit 26:

Track monitoring is de-activated for the square-wave encoders when the bit is set, even if the monitoring function is selected in p0405.2.

Re bit 28:

Monitoring of the difference between incremental and absolute position in the case of linear encoders.

Re bit 29:

When the bit is set, the EnDat encoder is initialized under a certain speed and, therefore, with high accuracy. If initialization at a higher speed is requested, fault F31151, F32151, or F33151 is output.

Re bit 31:

When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

<b>Description:</b>	Sets the filter time for a squarewave encoder. The hardware of the squarewave encoder only supports the following values: 0: No filtering 0.04 µs 0.64 µs 2.56 µs 10.24 µs 20.48 µs		
<b>Dependency:</b>	Refer to: r0452		
<b>Notice:</b>	If the filter time is too long, the track signals A/B/R may be suppressed and the appropriate messages output.		
<b>Note:</b>	The most suitable filter time depends on the number of pulses and maximum speed of the square-wave encoder. The filter time is automatically corrected to the next value when entering a non-specified value. In this case, no message is output. The effective filter time is displayed in r0452.

<b>Note:</b>	For encoders with serial number, encoder replacement is monitored in order to request angular commutation calibration (adjustment) for motor encoders and absolute calibration for direct measuring systems with absolute value data. The serial number, which from then onwards is used for monitoring purposes, can be transferred using p0440.

In the following cases, copying is automatically started in the following cases:

- 1.) When commissioning 1FT6, 1FK6, 1FK7 motors.
- 2.) When writing into p0431.
- 3.) For p1990 = 1.

p0440 is automatically set to 0 when the copying has been completed.

In order to permanently accept the copied values, it is necessary to save in a non-volatile fashion (p0977).

### 2.2 List of parameters

**Index:**  
 [0] = Encoder 1  
 [1] = Encoder 2  
 [2] = Reserved

**Caution:**

Following ramping-up or after a data set changeover, the new value is present at connector inputs which are interconnected to connector output r0479 and under certain circumstances take 100 ms to become available.

Reason:

These interconnections are updated in the background, unlike interconnections involving other connector outputs (e.g. CO: r0482).

The value is immediately available when non-cyclically reading r0479 (e.g. via the expert list).

Re bit 14, 15:  
r0481.14 = 1 and r0481.15 = 0 can have one of the following causes:  
- the encoder is parked.  
- the encoder is de-activated.  
- the encoder is being commissioned.  
- no parameterized encoder available.  
- encoder data set is being changed over.  
r0481.14 = 1 and r0481.15 = 1 has the following significance:  
An encoder error has occurred and the encoder position actual value (Gn\_XIST1) is invalid.

	0	5	0

**Description:** Sets the behavior for the ENCODER fault response (motor encoder).

This means, for example, if an encoder fault occurs, encoderless operation can be automatically selected with a shutdown behavior that can be selected.

**Value:**

0:	Encoder fault results in OFF2
1:	Enc fault results in encoderless oper. and oper. continues
2:	Encoder fault results in encoderless operation and OFF1
3:	Encoder fault results in encoderless operation and OFF3
4:	Encoder fault results in DC braking
5:	Enc fault results in encoderless op, operation continues, alarm

**Dependency:** The following parameters are relevant for encoderless operation.

Refer to: p0341, p0342, p1470, p1472, p1517, p1612, p1755

Refer to: F07575

**Caution:**

For a value = 1, 2, 3, 5 the following applies:

- encoderless operation must have been started.
- if, for synchronous motors, an encoder fault occurs below the switchover speed p1755, when switching over to encoderless operation, the motor can stall.

For a value = 1, 5 the following applies:

- in spite of the motor encoder fault that has occurred, the motor continues to operate.

**Note:** For a value = 1, 2, 3, the following applies:

- for encoderless operation the following condition must be fulfilled:  $p1800 \geq n / (2 * p0115[0])$ ,  $n = 1, 2$ , etc.
- Refer to the status signal "encoderless operation due to a fault" (BO: r1407.13).
- If, when setting r1407.13, a different drive data set is selected (e.g. interconnection from p0820), then the open-loop or closed-loop control type p1300 of this data set must match that of the original data set (e.g.  $p1300 = 21$ ). Encoderless closed-loop controlled operation is kept when changing over.

For a value = 4, the following applies:

- the value can only be set for all motor data sets when  $p1231 = 4$
- the function is not supported on synchronous motors
- For induction motors, DC braking is initiated on an encoder fault. DC braking must be commissioned ( $p1232$ ,  $p1233$ ,  $p1234$ ).

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [rpm]	210000.00 [rpm]	0.00 [rpm]

**Description:** Sets the maximum permissible speed difference within the current controller sampling time for squarewave encoders.

When the value is exceeded, depending on p0491, either encoderless closed-loop speed/torque control is selected or the drive is powered down.

**Dependency:** Refer to: F31118, A31418, F32118, A32418

**Note:** For a value of 0.0, the speed change monitoring is disabled.

if the set maximum speed difference is only exceeded for one sampling time of the current controller, then an appropriate alarm is output. However, if the maximum speed difference is exceeded over several sampling times, then a corresponding fault is output.

**Description:** Sets the input terminal for selecting the reference mark via BERO/switching signal when performing referencing with several zero marks.

The encoder interface supplies the position of the reference mark, which was detected immediately after the positive edge of the BERO signal.

**Value:**

- 0: No selection via BERO

- 2: DI/DO 10 (X132.3)
- 3: DI/DO 11 (X132.4)
- 7: DI/DO 8 (X132.1)

**Dependency:** Refer to: p0490

**Notice:** For CU310, CX32, NX10 and NX15, only DI/DO 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).

**Note:** Refer to the encoder interface for PROFIdrive.

The terminal must be set as input (p0728).

For p0493 = 0 (factory setting) the following applies:

- there is no logic operation between the reference mark search and an input signal.

For p0493 > 0, the following applies:

- the positive edge of the input signal is evaluated. If the negative edge is to be evaluated, signal inversion must be parameterized via p0490.

- if a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0580, p0680, p2517, or p2518.

<b>Description:</b>	Selects the input terminal for connecting an equivalent zero mark (external encoder zero mark).		
<b>Value:</b>	0: No equivalent zero mark (evaluation of the encoder zero mark) 1: DI/DO 9 (X132.2) 2: DI/DO 10 (X132.3) 3: DI/DO 11 (X132.4) 7: DI/DO 8 (X132.1)

<b>Dependency:</b>	Refer to: p0490, p0494		
<b>Notice:</b>	For p0494 > 0, the setting in p0494 and p0495 is invalid.		
<b>Note:</b>	Refer to the encoder interface for PROFIdrive. The terminal must be set as input. For p0495 = 0 (factory setting), the encoder zero mark is evaluated as zero mark. For p0495 > 0, the following applies: Depending on the direction of motion, the positive or negative edge at the appropriate input is evaluated. - increasing position actual values (r0482) --> the 0/1 edge is evaluated. - decreasing position actual values (r0482) --> the 1/0 edge is evaluated. Only one zero mark is supported. If function 2, 3 or 4 is selected, this results in a fault message in Gn_ZSW. The inversion of the inputs via p0490 affects the function "referencing with equivalent zero mark". This is the reason that the edge evaluation is interchanged as a function of the direction of motion. An input can only be assigned to one encoder as measuring probe 1, 2 or equivalent zero mark. Exception: The same encoder can be simultaneously used as measuring probe and equivalent zero mark as both functions cannot be simultaneously requested.

<b>Description:</b>	Sets the technology application. The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0578.		

<b>Value:</b>	100: Standard drive (SERVO) 101: Feed drive (limit current limitation) 102: Spindle drive (rated current limitation)
<b>Dependency:</b>	Refer to: p1520, p1521, p1530, p1531, p2000, p2175, p2177
<b>Caution:</b>	After changing over the technological application and then calculating the open-loop and closed-loop parameters, the behavior of the motor can have changed very significantly (e.g. the same setpoint results in a higher speed due to a different reference speed). For this reason extreme caution must be taken when the motor is started for the first time.
	
<b>Note:</b>	The calculation of parameters dependent on the technology application can be called up as follows: - when exiting quick commissioning using p3900 > 0 - when writing p0340 = 1, 3, 5 - when writing p0578 = 1 For p0500 = 100 and when the calculation is initiated, the following parameters are set: - p1520/p1521 = rated motor torque (r0333) - p1530/p1531= $2 \cdot \pi \cdot r0333 \cdot p0311$ (rotary) or $r0333 \cdot p0311$ (linear) - p2000 = rated motor speed (p0311) - p2175 = factory setting - p2177 = factory setting For p0500 = 101 and when the calculation is initiated, the following parameters are set: - p1520/p1521 = torque at the maximum motor current (p0323) - p1530/p1531= power at the maximum motor current (p0323) and rated motor speed (p0311) - p2000 = rated motor speed (p0311) - p2175 = maximum value - p2177 = 0.2 s For p0500 = 102 and when the calculation is initiated, the following parameters are set: - p1520/p1521 = rated motor torque (r0333) - p1530/p1531= $2 \cdot \pi \cdot r0333 \cdot p0311$ (rotary) or $r0333 \cdot p0311$ (linear) - p2000 = maximum motor speed (p0322) if p0322 is not equal to 0, otherwise rated motor speed (p0311) - p2175 = factory setting - p2177 = factory setting

<b>Description:</b>	Sets the sensor to monitor the motor temperature.		
<b>Value:</b>	0: No sensor 1: Temperature sensor via encoder 1 10: Temperature sensor via a BICO interconnection 11: Temperature sensor via Motor Module / CU terminals		
<b>Dependency:</b>	Refer to: r0458, p0601, p0603		
<b>Caution:</b>	If, for a selected temperature sensor (p0600 > 0), the motor temperature sensor is not connected but another encoder, then the temperature adaptation of the motor resistances must be switched out. Otherwise, in controlled-loop operation, torque errors will occur that will mean that the drive will not be able to be stopped.		
			
<b>Notice:</b>	The parameter is calculated in the drive using p0340 and is inhibited for p0340 > 0.		
<b>Note:</b>	Re p0600 = 0: With induction motors, the motor temperature is calculated using the motor temperature model (see also p0612.1). Re p0600 = 10: The BICO interconnection should be executed via connector input p0603. Re p0600 = 11: For the CU305, a temperature sensor can be connected to terminal X133.7/8. Information on how to connect up a temperature sensor is provided in the following reference: SINAMICS S110 Manual

**Dependency:** The thermal motor model is only calculated for p0612.1 = 1.  
Refer to: r0458, p0600, p0612

**Note:** The temperature sensor for the temperature evaluation is set in p0600.  
For p0600 = 10 (temperature sensor via a BICO interconnection), the setting in p0601 has no significance.  
Information on using temperature sensors is provided in the following literature:  
- hardware description of the appropriate components  
- SINAMICS S120 Commissioning Manual  
Re p0601 = 1 (PTC alarm & timer):  
Tripping resistance = 1650 Ohm.  
After the tripping resistance has been exceeded, an appropriate alarm is output and after the delay time set in p0606 has expired, an appropriate fault is output.  
Re p0601 = 3 (KTY84 and PTC (only for motors with DRIVE-CLiQ)):  
For motors with DRIVE-CLiQ and 2 temperature sensors, the value is automatically set. More than one temperature channel can only be evaluated using this particular setting.

**Description:** Sets the signal source to evaluate the motor temperature via a BICO interconnection.

**Dependency:** Refer to: p0600

**Note:** Temperature sensor KTY: Valid temperature range -48 °C ... 248 °C.  
PTC temperature sensor:  
For a value = -50 °C, the following applies: Motor temperature < nominal response temperature of the PTC.  
For a value = 250 °C, the following applies: Motor temperature >= nominal response temperature of the PTC.  
Note:  
When using a Terminal Module 31 (TM31), the following applies:  
- the sensor type used is set using p4100.  
- the temperature signal is interconnected using CO: r4105.

<b>Description:</b>	Sets the timer for the alarm threshold for the motor temperature monitoring function. This timer is started when the temperature alarm threshold (p0604) is exceeded. If the timer expires before the temperature in the meantime falls below the alarm threshold, the fault F07011 is output. If the temperature fault threshold (p0605) is prematurely exceeded before the timer has expired, then fault F07011 is immediately output. As long as the motor temperature has still not exceeded the fault threshold and the alarm thresholds have again been undershot, the fault can be acknowledged.

<b>Description:</b>	Sets the timer between the output of alarm and fault for a temperature sensor fault. If there is a sensor fault, this timer is started. If the sensor fault is still present after the timer has expired, a corresponding fault message is output.		
<b>Notice:</b>	The parameterized time is internally rounded-off to an integer multiple of 48 ms.		
<b>Note:</b>	If the motor is an induction motor, the timer is switched off when setting the minimum value and no alarm is output. Temperature monitoring is then based on the thermal model.

<b>Description:</b>	Sets the winding time constant. The time constant specifies the warm-up time of the cold stator winding when loaded with the motor standstill current up until a temperature rise of 63 % of the continuously permissible winding temperature has been reached.				
<b>Dependency:</b>	This parameter is only used for synchronous motors (p0300 = 2xx). Refer to: r0034, p0612, p0615 Refer to: F07011, A07012, A07910				
<b>Caution:</b>	This parameter is automatically pre-set from the motor database for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.				
<b>Note:</b>	When parameter p0611 is reset to 0, then this switches out the thermal I2t motor model (also refer to p0612). If no temperature sensor is parameterized, then the ambient temperature for the thermal motor model is referred to p0625.

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [Arms]	10000.00 [Arms]	0.00 [Arms]
<b>Description:</b>	Sets the current limit.		
<b>Dependency:</b>	Refer to: r0209, p0323		
<b>Note:</b>	The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305, p0323 and p0338. The current limit p0640 is limited to r0209 and p0323. The limit to p0323 is not realized if a value of zero is entered there. The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the Motor Module.		

The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 > 0 or using the automatic parameterization with p0340 = 3, 5. Parameter p0640 is pre-assigned as follows using the automatic parameterization (p0340 = 1, p3900 > 0) taking into account the limits r0209 and r0323:

- for induction motors: p0640 = 1.5 x p0305
- for synchronous motors: p0640 = p0338

<b>p0642[0...n] Encoderless operation current reduction / Encoderl op I_red</b>

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [%]	100.00 [%]	100.00 [%]
<b>Description:</b>	Sets the reduction for the current limit in encoderless operation. The value is referred to p0640.		
<b>Dependency:</b>	Refer to: r0209, p0323, p0491, p0640, p1300, p1404		
<b>Note:</b>	If the motor is operated both with encoder as well as without encoder (e.g. p0491 is not equal to 0 or p1404 < p1082) then the maximum current can be reduced in encoderless operation. This reduces disturbing saturation-related motor data changes in encoderless operation.		

<b>p0643[0...n] Overvoltage protection for synchronous motors / Overvolt_protect</b>

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	0
<b>Description:</b>	Sets the overvoltage protection for synchronous motors in the field-weakening range.		
<b>Value:</b>	0: No measure 1: Voltage Protection Module (VPM)		
<b>Dependency:</b>	Refer to: p0316, p1082, p1231, p9601, p9801 Refer to: F07432, F07906, F07907		
<b>Notice:</b>	When the speed limiting is removed, the user is responsible for implementing a suitable overvoltage protection.		
<b>Note:</b>	In the field-weakening range, synchronous motors can, when a fault condition exists, generate high DC link voltages. The following possibilities exist to protect the drive system from being destroyed due to overvoltage: - limit the maximum speed (p1082) without any additional protection. The maximum speed without protection is calculated as follows: $p1082 \text{ [rpm]} \leq 11.695 * r0297/p0316 \text{ [Nm/A]}$ - use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801). When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" must be connected to the VPM. - activating the internal voltage protection (IVP) with p1231 = 3.		

<b>p0650[0...n] Actual motor operating hours / Mot t_oper act</b>

	0 [h]	4294967295 [h]	0 [h]
<b>Description:</b>	Displays the operating hours for the corresponding motor. The motor operating time counter continues to run when the pulses are enabled. When the pulse enable is withdrawn, the counter is held and the value saved.		

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p0651  
Refer to: A01590

**Note:** The operating hours counter in p0650 can only be reset to 0. In this case, p0651 is automatically set to 0.  
For p0651 = 0, the operating hours counter is disabled.  
The operating hours counter only runs with motor data set 0 and 1 (MDS).

**Description:** Sets the service/maintenance intervals in hours for the appropriate motor.  
An appropriate fault is output when the operating hours set here are reached.

**Dependency:** Refer to: p0650  
Refer to: A01590

**Note:** For p0651 = 0, the operating hours counter is disabled.  
The operating hours counter only runs with motor data set 0 and 1 (MDS).

**Description:**

Sets the signal source for terminal DO 16.

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Terminal DO 16 is used for Safety Extended Functions if these have been enabled using p9601 and are not controlled via PROFIsafe, and provided that a signal source has been set for the F-DO using p10042.

The signal source entered in p0746 is then no longer output at terminal DO 16.

<b>Value:</b>	0: Inactive 1: Memory card to device memory 2: Device memory to memory card 12: Device memory (communication configuration) to memory card 1001: File on memory card cannot be opened		

## 2 Parameters

### 2.2 List of parameters

1002: File in device memory cannot be opened  
 1003: Memory card not found  
 1100: File cannot be transferred

**Dependency:**

Refer to: p0802, p0803

**Notice:**

The memory card must not be removed while data is being transferred.

**Note:**

If a parameter backup with setting 0 is detected on the memory card when the Control Unit is switched on (PS000xxx.ACX), this is transferred automatically to the device memory.  
 When the memory card is inserted, a parameter backup with setting 0 (PS000xxx.ACX) is automatically written to the memory card when the parameters are saved in a non-volatile memory (e.g. by means of "Copy RAM to ROM").  
 Once the data has been successfully transferred, this parameter is automatically reset to 0. If an error occurs, the parameter is set to a value > 1000. Possible fault causes:  
 p0804 = 1001:

**Description:**

Sets the signal source for the feedback signal of the contactors when changing over motors.

There is a fixed inter-relationship between energizing the contactor and the feedback signal.

Example:

A changeover is to be made between MDS0 (motor 0) and MDS1 (motor 1). The contactors should be switched using bit 4 (contactor 0) and 5 (contactor 1). The changeover should be made with an interconnection of the feedback signal.

Implementation:

MDS0: p0827[0] = 4, interconnect output to switch contactor 0 to r0830.4, p0831[4] = "input, feedback signal, contactor 0"

MDS1: p0827[1] = 5, interconnect output to switch contactor 1 to r0830.5, p0831[5] = "input, feedback signal, contactor 1"

The following sequence applies when changing over from MDS0 to MDS1:

1. The status bit r0830.4 is deleted. When the feedback signal (p0831[4]) is connected, the system waits until the feedback signal "contactor open" is displayed. If the feedback signal is not connected, then the system waits for the switch-off interlocking time of 320 ms.

2. The status bit r0830.5 is set. If the feedback signal (p0831[5]) is connected, the system waits until the feedback signal "contactor closed" is displayed. If the feedback signal is not connected, then the system waits for the switch-on interlocking time of 160 ms.

The signal is only influenced when an encoder changeover is set via p0187 or p0188.

Re bit 02:

A data set changeover is delayed by the time required for the internal parameter calculation.

Re bit 04:

A data set changeover is only carried out when the armature short circuit is not activated.

Re bit 05:

A data set changeover is only carried out when pole position identification, encoder adjustment, motor data identification, and rotating measurement are not running.

Re bit 06:

A data set changeover is only carried out when the friction characteristic record is not running.

Re bit 07 (VECTOR only):

A data set changeover is only carried out when rotating measurement is not running.

Re bit 08 (VECTOR only):

A data set changeover is only carried out when motor data identification is not running.

Re bit 10:

A motor changeover is set with p0833.1 = 1. It can only be carried out when the application performs pulse suppression.

Re bit 11:

A motor changeover is set with p0833.0 = 1. The pulses are only enabled when the "Motor changeover feedback" signal is detected.

## 2 Parameters

### 2.2 List of parameters

For the PROFIdrive profile, this command corresponds to control word 1 bit 3 (STW1.3).

BI: p0852 = 0 signal

Inhibit operation (suppress pulses).

BI: p0852 = 1 signal

Enable operation (pulses can be enabled).

**Caution:**

When "master control from PC" is activated, this binector input is ineffective.

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, then fault F06000 (infeeds) or F07802 (drives) is output.

**Dependency:**

Refer to: F07802, F30027

**Notice:**

The maximum time to pre-charge the DC link is monitored in the power unit and cannot be changed. The maximum duration of the pre-charging depends on the power class and the power unit design.

The monitoring time for the pre-charging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum pre-charging duration is exceeded.

**Note:**

The factory setting for p0857 depends on the power class and the design of the power unit.

The monitoring time for the ready signal of the power unit includes the time to pre-charge the DC link and, if relevant, the de-bounce time of the contactors.

If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault.

The address can be set as follows: 1) Using the DIP switch on the Control Unit. --> p0918 can then only be read and displays the selected address. --> A change only becomes effective after a POWER ON. 2) Using p0918 --> Only if all of the DIP switches are set to ON or OFF. --> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM". --> A change only becomes effective after a POWER ON.		
<b>Note:</b>	Permissible PROFIBUS addresses: 1 ... 126 Address 126 is used for commissioning. Every PROFIBUS address change only becomes effective after a POWER ON.

<b>Description:</b>	The parameter is used to initiate the reset of the parameters of an individual drive unit. Parameters of the basic drive commissioning (p0009) are not reset (p0107, p0108, p0111, p0112, p0115, p0121, p0130, p0131, p0140, p0141, p0142, p0170, p0186 ... p0188). These can only be reset using the factory setting of the complete drive unit (p0976).		
<b>Value:</b>	0: Inactive 1: Start a parameter reset 5: Starts a safety parameter reset 100: Start a BICO interconnection reset		
<b>Dependency:</b>	Refer to: F01659		
<b>Notice:</b>	It is not possible to modify parameters after changing the value.		
<b>Note:</b>	A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0. Parameter reset has been completed if p0970 and p0010 have been set to 0.		

For p0970 = 5 the following applies:

The password for Safety Integrated must be set.

When Safety Integrated is enabled, this can result in error messages, which then require an acceptance test to be performed.

Then save the parameters and carry out a POWER ON.

For p0970 = 1 the following applies:

If a Safety Integrated function is parameterized (p9601), then the safety parameters are not reset. In this case, a fault F01659 is output with fault value 2.

**Description:** Setting to save the parameter of the particular drive object in the non-volatile memory.

**Value:**  
0: Inactive  
1: Save drive object

**Dependency:** Refer to: p0977, p1960

**Caution:** If a memory card (optional) is inserted, the following applies:  
The parameters are also saved on the card and therefore overwrite any existing data!

 **Caution:** The Control Unit power supply may only be powered down after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).

**Notice:** Writing to parameters is inhibited while saving.

**Note:** Starting from the particular drive object, the following parameters are saved:  
CU3xx: Device-specific parameters and PROFIBUS device parameters.  
Other objects: Parameters of the actual object and PROFIBUS device parameters.  
Prerequisite:  
In order that the parameter of a drive object, saved with p0971 = 1, is read the next time that the Control Unit is booted, then all parameters must, as a minimum, have first been saved once with p0977 = 1.

**Description:** Sets the required procedure to execute a hardware reset for the drive unit.

**Value:**  
0: Inactive  
1: Hardware-Reset immediate  
2: Hardware reset preparation  
3: Hardware reset after cyclic communication has failed

**Danger:** It must be absolutely ensured that the system is in a safe condition.  
The memory card/device memory of the Control Unit must not be accessed.

 **Note:**  
If value = 1:  
Reset is immediately executed and communications interrupted.  
After communications have been established, check the reset operation (refer below).  
If value = 2:  
Help to check the reset operation.  
Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.  
After communications have been established, check the reset operation (refer below).

---

If value = 3:

The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.

If the cyclic communication is active for both PROFIdrive interfaces, then the reset is executed after completing both cycle communications.

After communications have been established, check the reset operation (refer below).

To check the reset operation:

After the drive unit has been restarted and communications have been established, read p0972 and check the following:

p0972 = 0? --> The reset was successfully executed.

p0972 > 0? --> The reset was not executed.

### p1030[0...n] Motorized potentiometer configuration / Mop configuration

SERVO_S110-DP (Ext setp), SERVO_S110-CAN (Ext setp), SERVO_S110-PN (Ext setp)	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dyn. index:</b> DDS, p0180	<b>Func. diagram:</b> 3020
	<b>P-Group:</b> Setpoints	<b>Unit group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-	-	0000 0110 bin

**Description:** Sets the configuration for the motorized potentiometer.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Data save active	Yes	No	-
	01	Automatic mode ramp-function generator active	Yes	No	-
	02	Initial rounding-off active	Yes	No	-
	03	Save in NVRAM active	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-

**Note:** Re bit 00:  
0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.  
1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.

Re bit 01:  
0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).  
1: With ramp-function generator in the automatic mode.  
For manual operation (0 signal via BI: p1041), the ramp-function generator is always active.

Re bit 02:  
0: Without initial rounding-off  
1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).  
The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:  
 $r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$   
The jerk acts up until the maximum acceleration is reached ( $a_{max} = p1082 [1/s] / p1047 [s]$ ), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.

## 2 Parameters

### 2.2 List of parameters

Re bit 03:

0: Non-volatile data save de-activated.

1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).

Re bit 04:

When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.

<b>Description:</b>	Sets the highest possible speed.		
<b>Dependency:</b>	Refer to: p0115, p0322, p0324, p0532		
<b>Notice:</b>	It is not possible to modify parameters after changing the value.		
<b>Note:</b>	The parameter applies for both motor directions. The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer). Since the parameter is part of quick commissioning (p0010 = 1), it is defined appropriately when p0310, p0311, p0322, p0324, p0530, p0531, and p0532 are changed. The following limits are always effective for p1082: $p1082 \leq \min(p0324, p0532) \text{ if } p0324 > 0 \text{ and } p0532 > 0$ $p1082 \leq p0322 \text{ if } p0324 = 0 \text{ or } p0532 = 0 \text{ and } p0322 > 0$ $p1082 \leq 60 / (10.0 * p0115[0] * r0313)$ $p1082 \leq 60 * \text{Maximum power unit pulse frequency} / (5.0 * r0313)$		

For the automatic calculation (p0340 = 1) the value of the parameter is pre-assigned the maximum motor speed (p0322). If p0322 = 0, the rated motor speed (p0311) is used as default (pre-assignment) value. For induction motors that are not catalog motors (p0301 = 0), the synchronous no-load speed is used as default (pre-assignment) value (p0310 \* 60 / r0313).

For synchronous motors, the following additionally applies:

In the automatic calculation (p0340 = 1), p1082 is limited to speeds for which the rated current of the power unit (S1 continuous operation r0207[3]) is not sufficient as field current:  $p1082 < p0348 / (1 - r0207 / r0331)$ , valid for  $r0207[3] < r0331$ .

On the other hand, an additional limit is effective, which prevents the EMF from exceeding the maximum DC link voltage (see p0643 and p1231).

The effective assignment of the motor data set parameter (e.g. p0311) to the drive data set parameter p1082 when pre-assigning should be taken from p0186.

p1082 is also available in the quick commissioning (p0010 = 1); this means that when exiting via p3900 > 0, the value is not changed.

0.000 [rpm]

210000.000 [rpm]

0.000 [rpm]

**Description:** Sets the bandwidth for the skip speeds/velocities 1 to 4.

**Dependency:** Refer to: p1091, p1092, p1093, p1094

**Note:** The setpoint (reference) speeds are skipped (suppressed) in the range of the skip speed +/-p1101. Steady-state operation is not possible in the skipped (suppressed) speed range. The skip (suppression) range is skipped.

Example:

p1091 = 600 and p1101 = 20

--> setpoint speeds between 580 and 620 [rpm] are skipped.

For the skip bandwidths, the following hysteresis behavior applies:

For a setpoint speed coming from below, the following applies:

r1170 < 580 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 580 [rpm]

For a setpoint speed coming from above, the following applies:

r1170 > 620 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 620 [rpm]

**Description:** Sets the signal source for the command "enable setpoint/inhibit setpoint".  
 For the PROFIdrive profile, this command corresponds to control word 1 bit 6 (STW1.6).  
 BI: p1142 = 0 signal  
 Inhibits the setpoint (the ramp-function generator input is set to zero).  
 BI: p1142 = 1 signal  
 Setpoint enable.

**Dependency:** Refer to: p1140, p1141

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Description:** Sets the signal source for accepting the setting value of the ramp-function generator.

**Dependency:** The signal source for the ramp-function generator setting value is set using parameters.

Refer to: p1144

**Note:** 0/1 signal:

The ramp-function generator output is immediately (without delay) set to the setting value of the ramp-function generator.

1 signal:

The setting value of the ramp-function generator is effective.

1/0 signal:

The input value of the ramp-function generator is effective. The ramp-function generator output is adapted to the input value using the ramp-up time or the ramp-down time.

0 signal:

The input value of the ramp-function generator is effective.

<b>Description:</b>	Sets the ramp-function generator tracking. The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration. The reference value is the deviation at the speed/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit.		
<b>Recommendation:</b>	p1145 = 0.0: This value de-activates the ramp-function generator tracking. p1145 = 0.0 ... 1.0: Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating. p1145 > 1.0: The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value.		
<b>Notice:</b>	If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration. Remedy: - switch off ramp-function generator tracking (p1145 = 0). - increase the ramp-up/ramp-down time (p1120, p1121).		
<b>Note:</b>	In the U/f mode, ramp-function generator tracking is not active. For SERVO with U/f operation, the following applies: The complete ramp-function generator is not active, i.e. ramp-up and ramp-down time = 0.

<b>Description:</b>	Sets the tolerance value for the status of the ramp-function generator (ramp-up active, ramp-down active). If the input of the ramp-function generator does not change in comparison to the output by more than the entered tolerance time, then the status bits "ramp-up active" and "ramp-down active" are not influenced.

<b>Description:</b>	Sets the automatic restart mode (AR).		
<b>Value:</b>	0: Inhibit automatic restart 1: Acknowledge all faults without restarting 4: Restart after line supply failure w/o additional start attempts 6: Restart after fault with additional start attempts 14: Restart after line supply failure following man. acknowledgment 16: Restart after fault following manual acknowledgment		
<b>Dependency:</b>	The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted. When using an Operator Panel in the LOCAL mode, then there is no automatic start. For p1210 = 14, 16, a manual acknowledgement is required for an automatic restart. Refer to: p0840, p0857 Refer to: F30003		
<b>Danger:</b>	If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is powered up as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is again present or the feedback of the line supply infeed (refer to p0864) is again available. This automatic power-up sequence can only be interrupted by withdrawing the ON command.		
<b>Caution:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). When faults are present, therefore, the parameter cannot be changed. For p1210 > 1, the motor is automatically started.		
<b>Note:</b>	Re p1210 = 1: Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts. Re p1210 = 4: An automatic restart is only carried out if fault F30003 occurred at the Motor Module or a 1 signal is present at binector input p1208[1]. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure.		

## 2 Parameters

### 2.2 List of parameters

Re p1210 = 6:

An automatic restart is carried out if any fault has occurred or there is a 1 signal at binector input p1208[0].

Re p1210 = 14:

As for p1210 = 4. However, faults that are present must be manually acknowledged.

Re p1210 = 16:

As for p1210 = 6. However, faults that are present must be manually acknowledged.

<b>Description:</b>	Sets the start attempts of the automatic restart function for p1210 = 4, 6.			
<b>Dependency:</b>	Refer to: p1210, r1214 Refer to: F07320			
<b>Caution:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).			
<b>Notice:</b>	After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated. After a complete power failure the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.			
<b>Note:</b>	A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized (r0056.4 = 1) and an additional delay time of 1 s has expired. As long as a fault is present, an acknowledge command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgement starts again from the beginning. Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available. At least one start attempt is always carried out. After a line supply failure, acknowledgement is immediate and when the line supply returns, the system is powered up. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgement also causes the start counter to be decremented.

<b>Caution:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).

<b>Dependency:</b>	Refer to: p1210, r1214			
<b>Caution:</b>	A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).			
<b>Notice:</b>	After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.			
<b>Note:</b>	Index 0: The monitoring time starts when the faults are detected. If the automatic acknowledgements are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output. The monitoring is de-activated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present). In the case of p1210 = 14, 16, the faults which are present must be acknowledged manually within the time in p1213 index 0. Otherwise, fault F07320 is generated after the set time. Index 1: The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213 index 1 has expired. The delay time is not effective for fault acknowledgement without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the power-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed.

## 2 Parameters

### 2.2 List of parameters

**Note:**

Re bit 00:  
State to display the single initialization after POWER ON.

Re bit 01:  
State in which the automatic restart function waits for faults (initial state).

Re bit 02:  
General display that a fault has been identified and that the restart or acknowledgement has been initiated.

Re bit 03:  
Displays the acknowledge command within the "acknowledge alarms" state (bit 4 = 1). For bit 5 = 1 or bit 6 = 1, the acknowledge command is continually displayed.

Re bit 04:  
State in which the faults that are present are acknowledged. The state is exited again after successful acknowledgement. A change is only made into the next state if it is signaled that a fault is no longer present after an acknowledgement command (bit 3 = 1).

Re bit 05:  
State in which the drive is automatically powered up (only for p1210 = 4, 6).

Re bit 06:  
State in which the system waits after having been powered up, to the end of the start attempt (to the end of the magnetizing process).  
For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.

Re bit 07:  
State which is assumed after a fault occurs within the automatic restart function. This is only reset after acknowledging the fault and withdrawing the power-on command.

Re bit 10:  
When the automatic restart function is active, r1214 bit 7 is displayed, otherwise the effective fault r2139 bit 3.

Re bits 12 ... 15:  
Actual state of the start counter (binary coded).

<b>Description:</b>	Sets the holding brake configuration.		
<b>Value:</b>	0: No motor holding brake available 1: Motor holding brake acc. to sequence control 2: Motor holding brake always open 3: Motor holding brake like sequence control connection via BICO		
<b>Dependency:</b>	Refer to: p1216, p1217, p1226, p1227, p1228, p1278		
<b>Caution:</b>	For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.		
<b>Notice:</b>	If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.		
<b>Note:</b>	If the configuration is set to "no holding brake present" when booting, then the motor holding brake will be automatically identified. If a motor holding brake is detected, the configuration is set to "motor holding brake as for sequence control". If a holding brake integrated in the motor is used, then it is not permissible that p1215 is set to 3. if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal. When the function module "extended brake control" is activated (r0108.14 = 1), r1229.1 should be interconnected as control signal. The parameter can only be set to zero when the pulses are inhibited. The parameterization "no motor holding brake available" and "Safe Brake Control" enabled (p1215 = 0, p9602 = 1, p9802 = 1) is not practical if there is no motor holding brake.		

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

<b>Description:</b>	Sets the time to open the motor holding brake. After controlling the holding brake (opens), the speed/velocity setpoint remains at zero for this time. After this, the speed/velocity setpoint is enabled.

<b>Description:</b>	Sets the time to apply the motor holding brake. After OFF1 or OFF3 and the holding brake is controlled (the brake closes), then the drive remains closed-loop controlled for this time stationary with a speed setpoint/velocity setpoint of zero. The pulses are suppressed when the time expires.		
<b>Recommendation:</b>	This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed.		
<b>Dependency:</b>	Refer to: p1215, p1216		
<b>Notice:</b>	If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag. If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime.

When braking with OFF1 or OFF3, when the threshold is undershot, standstill is identified.

The following applies when the brake control is activated:

When the threshold is undershot, the brake control is started and the system waits for the brake closing time in p1217. The pulses are then suppressed.

if the brake control is not activated, the following applies:

When the threshold is undershot, the pulses are suppressed and the drive coasts down.

**Dependency:**

Refer to: p1215, p1216, p1217, p1227

**Notice:**

For reasons relating to the compatibility to earlier firmware versions, a parameter value of zero in indices 1 to 31 is overwritten with the parameter value in index 0 when the Control Unit boots.

**Note:**

Standstill is identified in the following cases:

- the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired.
- the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired.

The actual value sensing is subject to measuring noise. For this reason, standstill cannot be detected if the speed threshold is too low.

**Description:**

Sets the monitoring time for the standstill identification.

When braking with OFF1 or OFF3, standstill is identified after this time has expired, after the setpoint speed has fallen below p1226 (also refer to p1145).

After this, the brake control is started, the system waits for the closing time in p1217 and then the pulses are suppressed.

**Dependency:**

Refer to: p1215, p1216, p1217, p1226

**Notice:**

For p1145 > 0.0 (RFG tracking) the setpoint is not equal to zero dependent on the selected value. This can therefore cause the monitoring time in p1227 to be exceeded. In this case, for a driven motor, the pulses are not suppressed.

**Note:**

Standstill is identified in the following cases:

- the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired.
- the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired.

For p1227 = 300.000 s the following applies:

Monitoring is de-activated.

For p1227 = 0.000 s, the following applies:

With OFF1 or OFF3 and a ramp-down time = 0, the pulses are immediately suppressed and the motor "coasts" down.

## 2 Parameters

### 2.2 List of parameters

**Note:**

Re p1231 = 1, 2:

The external armature short circuit can only be selected for synchronous motors (p0300). In this case, control bit BO: r1239.0 must be interconnected (e.g. to a digital input) to control the external contactor.

The external armature short circuit cannot be set as a fault response. It can be triggered via binector input p1230. It is also always activated in the case of pulse suppression.

Re p1231 = 4:

The function is activated as soon as the activation criterion is fulfilled.

- the function can be superseded by OFF2

a) This function is not supported for synchronous motors (p0300 = 2xx, 4xx).

b) For induction motors (p0300 = 1xx), the DC braking is initiated.

Activation criterion (one of the following criteria is fulfilled):

- binector input p1230 = 1 signal (DC braking activation).

- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).

- the internal pulse enable is missing (r0046.19 = 0).

Re p1231 = 5:

DC braking can only be set for induction motors.

DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1/OFF3, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely.

DC braking by means of fault response continues to be possible.

Re p1231 = 14:

DC braking can only be set for induction motors.

DC braking is initiated if binector input p1230 = 1 during operation and the actual speed is below the starting speed p1234 (before this, the drive must have operated above p1234 plus the hysteresis). Then, following upstream demagnetization (see p0347), the braking current p1232 is injected for the time set in p1233. The drive then changes into normal operation. During braking the command for DC braking can be withdrawn. If the time p1233 is exceeded, then DC braking is inhibited and the drive changes into normal operation.

For OFF1 and OFF3, DC braking is only executed, if binector input p1230 = 1 signal.

DC braking by means of fault response continues to be possible.

Re p1231 = 4, 5, 14:

The value can only be changed to values not equal to 4 or 14 if p0491 is not equal to 4 and p2101 is not equal to 6 (armature short circuit/DC braking not set).

The braking current and braking duration must, therefore, be dimensioned accordingly for this situation so that the drive can be decelerated to standstill. In the case of operation with an encoder, this speed may not be set too low so as ensure that the oscillation movement induced by the residual flux/remanence of the motor does not cause DC braking to be de-activated again.

External armature short-circuit (bits 0 ... 3):

Re bit 00:

Using this signal, the motor is short-circuited through an external contactor circuit. This means that this BO: p1239.0 must be interconnected e.g. to a digital output.

Re bit 01:

This signal indicates the state of the contactor to establish the armature short-circuit. To do this, BI: p1235 must be interconnected to a digital input.

Re bit 02:

The external armature short-circuit configuration is ready and is activated as soon as the activation criterion is fulfilled.

Re bit 03:

1: A feedback signal from an external contactor was parameterized in BI: p1235.

Internal voltage protection / internal armature short-circuit (bits 4 ... 6):

Re bit 04:

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module does not support the autonomous internal voltage protection (r0192.10 = 0).

The Control Unit issues the command to the Motor Module to short-circuit the motor through the power semiconductors.

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1).

The Motor Module decides autonomously whether the armature short-circuit is activated. In this case, the following applies: r1239.4 = r1239.5.

c) Internal armature short-circuit (p1231 = 4) was selected.

The Control Unit issues the command to the Motor Module to short-circuit the motor through the power semiconductors.

Re bit 05:

The Motor Module signals that the motor is short-circuited in the Motor Module through the power semiconductors.

Re bit 06:

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module does not support the autonomous internal voltage protection (r0192.10 = 0).

The internal voltage protection is ready and is activated as soon as the activation criterion is fulfilled.

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1).

The internal voltage protection is ready and the Motor Module decides autonomously - using the DC link voltage - whether the short-circuit is activated. In this case, protection is also provided even if the DRIVE-CLiQ connection between the Control Unit and Motor Module was interrupted. The short-circuit is activated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the short-circuit is withdrawn.

c) Internal armature short-circuit (p1231 = 4) was selected.

The internal armature short-circuit is ready and is activated as soon as the activation criterion is fulfilled.

- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

<b>Description:</b>	Sets the configuration of the controller or monitoring for the DC link voltage (Vdc).		
<b>Value:</b>	0: Inhib Vdc ctrl 1: Enable Vdc_max controller 2: Enable Vdc_min controller (kinetic buffering) 3: Enable Vdc_min controller and Vdc_max controller 4: Activate Vdc_max monitoring 5: Activate Vdc_min monitoring 6: Activate Vdc_min monitoring and Vdc_max monitoring 7: Enable Vdc_max controller without accelerating 8: Enable Vdc_min controller without braking 9: Enable Vdc_min and Vdc_max controller w/o braking/accelerating		
<b>Dependency:</b>	Refer to: p1244, p1248, p1250, p1532		
<b>Notice:</b>	During a few steps of the rotating measurement (p1960 = 1) the Vdc_min controller and/or Vdc_max controller is disabled.		
<b>Note:</b>	p1240 = 1, 3: When the upper DC link voltage threshold is reached (p1244), then the following applies: - the Vdc_max controller limits the regenerative energy in order that the DC link voltage is kept below the maximum DC link voltage when braking. - when other drives regenerate into the DC link, then the Vdc_max controller causes the motor to accelerate. p1240 = 2, 3: When the lower DC link voltage threshold is reached (p1248), the following applies: - the Vdc_min controller limits the energy taken from the DC link in order to keep the DC link voltage above the minimum DC link voltage when accelerating. - the motor is braked in order to use its kinetic energy to buffer the DC link. p1240 = 4, 5, 6: When the threshold in p1244 or p1248 is reached, the DC link voltage monitoring initiates a fault with a response and therefore reduces additional negative effects on the DC link voltage.		

p1240 = 7, 9:

As for p1240 = 1, 3. However, the motor is prevented from accelerating due to the fact that other drives are regenerating. The effective lower torque limit cannot exceed the offset of the torque limit (p1532).

p1240 = 8, 9:

As for p1240 = 2, 3. However, the motor is prevented from braking due to the fact that the DC link voltage has been lowered. The effective upper torque limit cannot be less than the offset of the torque limit (p1532).

**Value:**  
 0: Brake control with diagnostics evaluation  
 1: Brake control without diagnostics evaluation

**Note:** If the configuration of the motor holding brake (p1215) is set to "no holding brake present" when booting, then an automatic identification of the motor holding brake will be carried out. If a brake control is detected without diagnostics evaluation (e.g. Brake Relay for AC Drive), then the parameter is set to "brake control without diagnostics evaluation".

It is not permissible to parameterize "brake control without diagnostics evaluation" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).

### 2.2 List of parameters

**Note:** The following applies for firmware version 4.3 and higher:  
When U/f control is activated, resonance damping is automatically activated. The resonance damping must be deactivated (p1338 = 0) in order to obtain pure diagnostics operation without the influence of actual values.  
Further, when U/f control is activated, the following functions are active:  
- Vdc controller (p1240, p1244, p1248, p1250).  
- the up ramp is limited by the set M, P and I limits (p0326, p0341, p0342, p0640, p1520, p1521, p1530, p1531, p1498).  
- the ramp-function generator is held if the current actual value exceeds the current limit set in p0640.

<b>Description:</b>	Sets the configuration for the closed-loop speed control.

	13	Motoring/regenerative depending on	Speed setpoint	Speed actual value	-
	16	I component for limiting	Enable	Hold	-
	18	Moment of inertia estimator active	Yes	No	-

**Note:** Re bit 07:  
The interpolator is only effective for clock-cycle synchronous PROFIBUS operation and when the master receives a sign-of-life (STW 2.12 ... STW 2.15). Further, for active Dynamic Servo Control (DSC) an additional dead time of one speed controller clock cycle is obtained.

Re bit 10:  
The pre-control signal via connector input p1430 only becomes effective at p1402.4 = 1 (torque-speed pre-control with encoder) at p1400.10 = 0 (for setp\_filter 2).

Re bit 11:  
If the motor rotates when the pulses are enabled, then we recommend p1400.11 = 1 (starting value = setpoint) with the matching sign.  
If the motor remains stationary (zero speed) when the pulses are enabled, then we recommend p1400.11 = 0 (starting value = 0.0).

Re bit 12:  
If a changeover is made from operation with encoder to encoderless operation while accelerating (with the threshold from p1404), then we recommend p1400.12 = 0.  
If the changeover is made from operation with encoder to encoderless at constant speed/velocity (e.g. with a DDS changeover or if there is an encoder fault via p0491) then we recommend p1400.12 = 1.

Re bit 18:  
Only active when the "moment of inertia estimator" function module is active (r0108.10 = 1).  
For operation with encoder, in addition, p1402.4 must be set to 1.  
The result of the moment of inertia estimator is displayed in r1493 when the function is activated.  
The function assumes that speed changes are made without load. If a speed change must be realized under load, then during this time, the estimated moment of inertia should be frozen using binector input p1502.

## 2 Parameters

### 2.2 List of parameters

**Note:** The changeover speed applies when changing over between operation with and without encoder.  
 With p1404 > 0, the effective changeover speed is limited to values greater than or equal to p1755 in order to avoid controlled operation.  
 Separate speed controllers should be set when operating with and without encoder.  
 - Operation with encoder: p1460 (Kp), p1462 (Tn), p1461, p1463, p1457, p1458 (speed controller adaptation)  
 - Operation without encoder: p1470 (Kp), p1472 (Tn)  
 For encoderless operation (p1404 = 0 or p1300 = 20), the following applies:  
 - The condition must be fulfilled:  $p1800 \geq n / (2 * p0115[0])$ , n = 1, 2, ...  
 - For motors with a small power rating (< 300 W) we recommend to set  $n \geq 2$ .

- it is not permissible that OFF1, OFF3 or STOP2 are active.
- it is not permissible that the motor data identification is active.
- Master control must not be active.

The following conditions can mean that the DSC function is not active in spite of the fact that the bit is set:

- clock-cycle synchronous operation is not selected (r2054 not equal to 4).
- the PROFIBUS is not clock-cycle synchronous (r2064[0] not equal to 1).
- DSC is not switched on at the control side; this means that KPC = 0 is transferred as the value at CI: p1191.

<b>Description:</b>	Displays the parameterized total moment of inertia ((p0341 * p0342) + p1498) without evaluation by the scaling via p1497.		
<b>Dependency:</b>	Refer to: p1300, p1402, p1404, p1497		
<b>Note:</b>	The parameterized total moment of inertia, taking into account p1497, influences the torque pre-control. In encoderless operation or when the torque-speed pre-control with encoder (p1402.4 = 1) is activated, then torque-speed pre-control is activated.

<b>Description:</b>	Sets the time constant of the PT1 filter for integrator feedback. The integrator of the speed controller is re-parameterized to become a PT1 filter through a feedback element (1st Order low pass filter characteristics). The following applies: p1494 < 0.25 (2 x p0115[1]) --> the PT1 filter is not active - the pure integrator is effective. p1494 >= 0.25 (2 x p0115[1]) --> the PT1 filter is active and has replaced the pure integrator.		
<b>Note:</b>	Applications: Motion at zero setpoint and dominant stiction can be suppressed but this has a negative impact on the remaining setpoint-actual value difference. This can be used, for example, to avoid oscillation of a position-controlled axis at standstill (stick-slip effect) or overshoot when traversing (moving) in micrometer steps. Also prevents tension/stressing for axes that are mechanically and rigidly coupled with one another (e.g. for synchronous spindles, master - slave axes).

	<b>Not for motor type:</b> PMSM, REL, FEM	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	20 [%]	100 [%]	100 [%]
<b>Description:</b>	Sets the factor to which the flux is reduced under no-load conditions. For a value of 100%, the flux reduction is switched out. This parameter refers to the flux saved in the field weakening characteristic. By reducing the flux, the losses in induction motors can be reduced under no-load conditions or at low torques. However, the time it takes to reach the maximum torque is extended.		
<b>Recommendation:</b>	For induction motors with closed rotor slots, we recommend that the integral time of the current controller (p1717) is e.g. increased to three times the value. For stable operation, the maximum field-weakening factor in operation with an encoder must be less than 16 and in operation without an encoder must be less than 4. Lower field weakening factors are recommended. The field weakening factor is calculated as follows: $(p1082 * 100 \% * 600 \text{ V}) / (p0348 * p1581 * p0070)$ In order to reduce losses due to magnetizing and de-magnetizing, we recommend that the smoothing times are adapted for flux decrease (p1578) and flux build-up (p1579). In order to reduce the losses as a result of building-up and reducing the torque, we recommend that the torque setpoint is smoothed (current setpoint filter (p1656 ...) or speed actual value filter (p1441)).		
<b>Dependency:</b>	Refer to: p1578, p1579		
<b>Note:</b>	It only makes sense to activate this function if there are low dynamic requirements placed on the speed controller and there are frequent phases with a low load. In order to avoid oscillations, if required, the speed controller parameters should be adapted (decrease Kp (p1460, p1470), increase Tn (p1462, p1472)). When used without an encoder, flux reduction is not possible for induction motors with closed rotor slots.

	1.000 [kHz]	32.000 [kHz]	4.000 [kHz]
<b>Description:</b>	Sets the pulse frequency for the converter. This parameter is pre-set to the rated converter value when the drive is first commissioned.		
<b>Dependency:</b>	The pulse frequency can, depending on the current controller sampling time (p0115[0]) assume the following values: a) $p1800 = 1000 / (p0115[0] * n)$ with $n = 2, 3, 4, 5$ b) $p1800 = 1000 * n / p0115[0]$ with $n = 1, 2, 3, 4, \dots$ Example: $p0115[0] = 125 \mu s \rightarrow p1800 = 1.6, 2, 2.6, 4 \text{ kHz}$ (from equation a) $p0115[0] = 125 \mu s \rightarrow p1800 = 8, 16 \text{ kHz}$ (from equation b) Possible setting values can be taken from r0114 (if p0009 = p0010 = 0). Refer to: p0115		
<b>Note:</b>	The maximum possible pulse frequency is also determined by the power unit being used. When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067). If p1800 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).		

For encoderless operation (p1404 = 0 or p1300 = 20), the following conditions apply:

$$p1800 = 1 / (2 * p0115[0])$$

or

$$p1800 \geq n / p0115[0], n = 1, 2, \dots$$

For motors with a low power rating (< 300 W) we recommend that p1800 is set acc. to the second condition.

<b>Note:</b>	Re bit 11: Precondition: - firmware version 4.4 or higher for the Control Unit and power unit. - booksize power unit (r0192.27 = 1). - current controller sampling time p0115[0] >= 62.5 µs. - for a Double Motor Module the two drive controls must be operated with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time. - it is not permissible that the "safety without encoder" is activated (p9306/p9506). The following changes are necessary after changing bit 11: - computing dead time (p0118 = 22 µs for bit 11 = 1, p0118 = 0 µs for bit 11 = 0). - controller gains (p1715, p1460). - with p0340 = 4 computing dead time and controller gains can be automatically pre-assigned. It may be necessary to still optimize the speed controller. Before commissioning for the first time (p3925.0 = 0 for all data sets) this parameter is automatically preassigned to the optimum value.

<b>Description:</b>	Sets the phase shift for offset clocking. For the first active power unit, it is specified whether clocking is to start at 0° (value = 0) or 180° (value = 1). All other active power units are clocked alternately according to the setting made here.			
<b>Note:</b>	A change only becomes effective after a POWER ON. The parameter is not influenced by setting the factory setting.

<b>Description:</b>	Setting to change the direction of rotation. If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.				
<b>Value:</b>	0: CW 1: CCW				
<b>Dependency:</b>	Refer to: F07434				
<b>Notice:</b>	An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled.				
<b>Note:</b>	For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft.  When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]).

<b>Description:</b>	Sets the configuration for the motor data identification.				
<b>Recommendation:</b>	For the stationary motor data identification, if a motor holding brake is being used it should be opened and the motor finely synchronized before the measurement. This should only be done if it can be safely carried out and no external forces can act on the motor. This determines the angular commutation offset (p1909.13, p0431).

<b>Description:</b>	Setting to control the motor data identification with the motor stationary.			
<b>Value:</b>	-3: Accept identified parameters -2: Acknowledge encoder inversion actual value (F07993) -1: Start motor data identification without acceptance 0: Inactive/inhibit 1: Start motor data identification with acceptance			
<b>Recommendation:</b>	For motors with brakes, the brake should be opened before carrying out the stationary motor data identification routine (p1215 = 2) as long as this can be done without incurring any danger. The commutation angle and the direction of rotation are also determined.			
<b>Dependency:</b>	Refer to: p1909, r1912, r1913, r1915, r1925, r1927, r1932, r1933, r1934, r1935, r1936, r1950, r1951 Refer to: F07990, A07991, F07993			
<b>Caution:</b>	For motors without brake or with the brake open (p1215 = 2), for the stationary (zero speed) measurement, the motor may rotate slightly.			
				
<b>Notice:</b>	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).			
<b>Note:</b>	Motor data identification can only be selected when the pulses of all of the drive objects of the Control Unit have been suppressed. After selection, all of the other drive objects of the Control Unit are interlocked so that they cannot be powered up until the motor data identification has been completed or de-selected. After a started motor identification is ended, the parameter is automatically reset to 0. A motor data identification that is presently being carried out can be terminated with p1910 = 0.

<b>Description:</b>	Sets the ramp-up/ramp-down time for the rotating measurement. The following applies for negative values: When the function module "extended setpoint channel" is activated (r0108.8 = 1), the maximum of the ramp-up/ramp-down time of the setpoint channel becomes effective. When this function module is inactive, then no ramp-up/ramp-down time is effective. The following applies for positive values: The selected ramp-up/ramp-down time becomes effective.			
<b>Recommendation:</b>	A ramp-up/ramp-down time should not be activated for the motor data identification (p1958 = 0) as long as this can be safely done without incurring any danger. This means that the identification is complete and more accurate. When the ramp-up/ramp-down time is activated, the following steps of the rotating motor data identification are not executed: - p1959.5 (identifying the q inductance) - p1959.7 (identifying the reluctance torque constant)

<b>Description:</b>	Sets the configuration of the rotating measurement.				
<b>Recommendation:</b>	A direction inhibit should not be activated for the rotating measurement (p1959.14 = 1 and p1959.15 = 1) as long as this can be done without incurring any danger. This means that the identification is complete and more accurate. When the direction inhibit is activated, the reluctance torque constant (p1959.7) is not identified and the angular commutation offset (p1959.10, p0431) is inaccurately determined. The reluctance torque constant (p1959.7) is also not identified in encoderless operation.

<b>Notice:</b>	The step p1959.8 (identify q inductance on the test stand) may only be selected if the drive can be kept at zero speed or at a fixed speed either using a test stand or other mechanical measures. During steps p1959.2 (identifying the moment of inertia) and p1959.6 (identifying the torque constant) the Vdc_min controller is disabled (p1240). During step p1959.7 (identifying the reluctance torque constant) the Vdc_min controller and Vdc_max controller are disabled (p1240).				

**Note:** For an induction motor (ASM), the following bits 1, 2, 5, 8, 9, 10, 14, 15 are effective  
 For a synchronous motor (SRM), the following bits 2, 5, 6, 7, 8, 10, 14, 15 are effective  
 Re bit 05:  
 For "motor holding brake the same as sequence control" (p1215 = 1 or 3), the Lq characteristic is only measured up to approximately the rated motor current (p0305) instead of up to the current limit (p0640). Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.  
 Re bit 10:  
 If the motor holding brake is set just the same as the sequence control (p1215 = 1 or 3), the commutation angle and the direction of rotation are not measured. Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.  
 Re bit 14, 15:  
 The following applies for bit 14 and 15 = 0:  
 When the function module "extended setpoint channel" is activated (r0108.8 = 1), the direction inhibit of the setpoint channel becomes effective. No direction of inhibit is effective if the function module is inactive.  
 The following applies for minimum bit 14 = 1 or bit 15 = 1:  
 The direction inhibit set in p1959 becomes effective.

<b>Danger:</b> 	For the rotating measurement, the motor is accelerated up to the maximum speed. Only the parameterized current limit (p0640) and the maximum speed (p1082) are effective. The behavior of the motor can be influenced using the direction inhibit (p1959.14, p1959.15) and the ramp-up/ramp-down time (p1958).			
<b>Notice:</b>	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).			
<b>Note:</b>	The rotating measurement can only be selected when the pulses of all of the drive objects of the Control Unit have been suppressed. After selection, all of the other drive objects of the Control Unit are interlocked so that they cannot be powered up until the rotating measurement has been completed or de-selected. When the rotating measurement is activated (p1960 = 1), it is not possible to save the parameters (p0971, p0977).

<b>Notice:</b>	If the incorrect technique is applied, this can cause the motor to accelerate in an uncontrolled fashion. <b>Description:</b>	Sets the reference quantity for speed and frequency. All speeds or frequencies specified as relative value are referred to this reference quantity. The reference quantity in this parameter corresponds to 100% or 4000 hex or 4000 0000 hex.:		
<b>Dependency:</b>	Refer to: p0500, p2001, p2002, p2003, r2004		
<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.		

Example 1:

The signal of an analog input (e.g. r4055[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000).

Example 2:

The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).

	10 [Vrms]	100000 [Vrms]	1000 [Vrms]
<b>Description:</b>	Sets the reference quantity for voltages. All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC-link voltage. The reference quantity in this parameter corresponds to 100% or 4000 hex or 4000 0000 hex.		
	<b>Note:</b> This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.		
<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity. Example: The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.

	0.10 [Arms]	100000.00 [Arms]	100.00 [Arms]
<b>Description:</b>	Sets the reference quantity for currents. All currents specified as relative value are referred to this reference quantity. The reference quantity in this parameter corresponds to 100% or 4000 hex or 4000 0000 hex.		
<b>Notice:</b>	If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for trace records). Example: p2002 = 100 A Reference quantity 100 A corresponds to 100 % p305[0] = 100 A Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current p305[1] = 50 A Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current		

## 2 Parameters

### 2.2 List of parameters

**Note:** For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.  
 If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.  
 For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage (p2002 = r0206 / p0210 / 1.73) is pre-assigned as the reference quantity.  
 Example:  
 The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example: The actual value of the total torque (r0079) is connected to a test socket (e.g. p0771[0]). **Description:** Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".

Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

**Value:**

- 0: Freeze setpoints and continue to process sign-of-life
- 1: Freeze setpoints and sign-of-life
- 2: Do not freeze setpoints

**Recommendation:** Do not change the setting p2037 = 0.

**Note:** If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

**Description:** Sets the interface mode of the PROFIdrive control words and status words.

When selecting a telegram via p0922 (p2079), this parameter influences the device-specific assignment of the bits in the control and status words.

**Value:**

- 0: SINAMICS
- 1: SIMODRIVE 611 universal

Contrary to p0922, a telegram can be selected using p2079 and subsequently expanded.

For p0922 < 999 the following applies:

p2079 has the same value and is inhibited. All of the interconnections and extensions contained in the telegram are inhibited.

For p0922 = 999 the following applies:

p2079 can be freely set. If p2079 is also set to 999, then all of the interconnections can be set.

For p0922 = 999 and p2079 < 999 the following applies:

The interconnections contained in the telegram are inhibited. However, the telegram can be extended.

Sets the send and receive telegram.

Contrary to p0922, a telegram can be selected using p2079 and subsequently expanded.

For p0922 < 999 the following applies:

p2079 has the same value and is inhibited. All of the interconnections and extensions contained in the telegram are inhibited.

For p0922 = 999 the following applies:

p2079 can be freely set. If p2079 is also set to 999, then all of the interconnections can be set.

For p0922 = 999 and p2079 < 999 the following applies:

The interconnections contained in the telegram are inhibited. However, the telegram can be extended.

**Value:**

- 7: Standard telegram 7, PZD-2/2
- 9: Standard telegram 9, PZD-10/5
- 110: SIEMENS telegram 110, PZD-12/7
- 111: SIEMENS telegram 111, PZD-12/12
- 999: Free telegram configuration with BICO

**Dependency:** Refer to: p0922

<b>Value:</b>	0: NONE 1: OFF1 2: OFF2 3: OFF3 4: STOP1 (being developed) 5: STOP2 6: DC braking 7: ENCODER (p0491)		
<b>Dependency:</b>	The fault is selected and the required response is set under the same index. Refer to: p2100		
<b>Notice:</b>	It is not possible to re-parameterize the response to a specific fault for faults that are already present (queued).		

**Note:** The fault response can only be changed for faults with the appropriate identification (see the List Manual, chapter "Faults and alarms").

Example:

F12345 and fault response = OFF3 (OFF1, OFF2, NONE)

--> The default fault response OFF3 can be changed to OFF1, OFF2 or NONE.

Re value = 1 (OFF1):

Braking along the ramp-function generator down ramp followed by a pulse inhibit.

Re value = 2 (OFF2):

Internal/external pulse inhibit.

Re value = 3 (OFF3):

Braking along the OFF3 down ramp followed by a pulse inhibit.

Re value = 5 (STOP2):

n\_set = 0

Re Value = 6 (DCBRK):

The value can only be set for all motor data sets when p1231 = 3, 4.

a) This function is not supported for synchronous motors (p0300 = 2xx, 4xx).

b) For induction motors (p0300 = 1xx), the DC braking is initiated.

Re value = 7 (ENCODER (p0491)):

The fault response set in p0491 is executed if applicable.

## 2 Parameters

### 2.2 List of parameters

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

Alarm buffer structure (general principle):

r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest)

...

r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest)

When the alarm buffer is full, the alarms that have gone are entered into the alarm history:

r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest)

...

r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)

<b>Note:</b>	Re bit 00: Alarm A07903 is output when the bit is set with r2197.7 = 0 (n_set <> n_act).				
	Re bit 01: When the bit is set, load monitoring is only carried out in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190).				
	Re bit 03: When the bit is set, r2197 bit 1 and bit 2 are determined via separate hystereses.				
	Re bit 15: The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out. If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

<b>Dependency:</b>	Refer to: r1084, r1087, r2197		
<b>Notice:</b>	For p0322 = 0, the following applies: p2162 <= 0.1 * p0311 For p0322 > 0, the following applies: p2162 <= 1.02 * p0322 - p1082 If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.		
<b>Note:</b>	For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value. If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

	00	Data save active	Yes	No	-
	02	Initial rounding-off active	Yes	No	-
	03	Non-volatile data save active for p2230.0 = 1	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-
<b>Dependency:</b>	Refer to: r2231, p2240				
<b>Note:</b>	Re bit 00: 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240. 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1. Re bit 02: 0: Without initial rounding-off 1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237). It is calculated as follows: $r = 0.0001 \times \max(p2237,  p2238 ) [\%] / 0.13^2 [s^2]$ The jerk is effective until the maximum acceleration is reached ( $a_{max} = p2237 [\%] / p2247 [s]$ or $a_{max} = p2238 [\%] / p2248 [s]$ ), after which the drive continues to run linearly with constant acceleration. The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time. Re bit 03: 0: Non-volatile data save de-activated. 1. The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1). Re bit 04: When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

<b>Note:</b>	<p>Re bit 00 = 0: The ramp-down time (p2258) switches to the ramp-up time (p2257) when the sign for the output signal r2260 changes. When the sign changes, the output signal is kept at zero for one arithmetic cycle.</p> <p>Re bit 00 = 1: When r2260 exhibits a positive gradient, the ramp-up time (p2257) is active; when it exhibits a negative gradient, the ramp-down time (p2258) is active. The sign for r2260 does not have any effect on the ramp time.</p> <p>Re bit 01 = 0: The integration time of the PID controller is evaluated with the gain factor Kp (p2280) (p2285 = integral time).</p> <p>Re bit 01 = 1: The integration time of the PID controller is independent of the gain factor (p2285 = integration time) if p2280 &gt; 0.</p> <p>Re bit 02 = 0: When the PID controller is de-activated via p2200, the output signal r2294 is reduced to zero via the ramp-down time p2293.</p> <p>Re bit 02 = 1: When the PID controller is de-activated via p2200, the output signal r2294 is set directly to zero.</p> <p>Re bit 03 = 0: The actual values are not limited by p2267 and p2268.</p> <p>Re bit 03 = 1: The actual values are limited by p2267 and p2268.</p>

<b>Description:</b>	Setting to invert the actual value signal of the technology controller. The inversion depends on the sensor type for the actual value signal.		
<b>Value:</b>	0: No inversion 1: Inversion actual value signal		

**Caution:** If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!

**Note:** The correct setting can be determined as follows:

- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal of the technology controller.
- > If the actual value increases as the motor speed increases, then p2271 should be set to 0 (no inversion).
- > If the actual value decreases as the motor speed increases, then p2271 should be set to 1 (the actual value signal is inverted).

If value = 0: The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor). If value = 1: The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

<b>Description:</b>	Sets the neutral length units LU per load revolution. Therefore, for a rotary encoder, a reference is established between the physical arrangement and the neutral length units LU used in the drive. Example: Rotary encoder, ballscrew with 10 mm/revolution, 10 mm should be broken down to units of $\mu\text{m}$ (i.e. 1 LU = 1 $\mu\text{m}$ ). --> One load revolution corresponds to 10000 LU --> p2506 = 10000		
<b>Note:</b>	The position controller can only process position setpoints in the interpolator clock cycle (IPO clock cycle) in integer length units (LU, Length Unit). This is the reason that speed setpoints that are not a multiple integer of 1 LU per IPO clock cycle can only be realized as an average. The result speed setpoint steps are especially noticeable for a high loop gain or when the pre-control is active. Increasing p2506 counteracts this behavior.

## 2 Parameters

### 2.2 List of parameters

**Caution:**

For rotating absolute encoders, when adjusting, a range is set up symmetrically around zero with half of the encoder range, within which the position must be re-established after powering down/powering up. In this range, it is only permissible that the encoder overflows.

After the adjustment has been completed, it must be guaranteed that the range is not exited. The reason for this is that outside the range, there is no clear reference any longer between the encoder actual value and mechanical system.

If the reference point (CI: p2598) lies in this range, then the position actual value is set when adjusting to the reference point. Otherwise, adjustment is canceled with F07443.

There is no overflow for linear absolute encoders. This means that after the adjustment, the position can be re-established in the complete traversing range after powering down/powering up. When adjusting, the position actual value is set to the reference point.

**Note:**

The encoder adjustment is initiated with p2507 = 2. The status is displayed using the other values.

In order to permanently save the determined position offset (p2525) it must be saved in a non-volatile fashion (p0971, p0977).

This adjustment can only be initiated for an absolute encoder.

**Description:** Sets the input terminal for direct measuring probe 1.

The direct measuring probe can either be parameterized as a non-cyclic (value 1 ... 8) or a cyclic (value 11 ... 18) measuring probe.

After it has been activated via BI: p2509 = 0/1 signal, the non-cyclic measuring probe measures once and can be used with EPOS.

After it has been activated via the p2509 = 1 signal, the cyclic measuring probe measures cyclically and cannot be used with EPOS.

In order to process signals faster, the direct measuring probe bypasses the handshake technique via the encoder control word and encoder status word.

**Value:**

0:	No meas probe
1:	DI/DO 9 (X132.2)
2:	DI/DO 10 (X132.3)
3:	DI/DO 11 (X132.4)
7:	DI/DO 8 (X132.1)
11:	DI/DO 9 cyclic
12:	DI/DO 10 cyclic
13:	DI/DO 11 cyclic
17:	DI/DO 8 cyclic

**Index:** [0] = Encoder 1  
 [1] = Encoder 2  
 [2] = Reserved

**Dependency:** Refer to: p0490, p0728, p2509, p2510, p2511

**Note:** DI/DO: Bidirectional Digital Input/Output

The terminal must be set as input (p0728).

If a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0488, p0489, p0493, p0494, p0495, p0580 or p0680.

Direct measurement via p2517 has a higher priority than measurements via p0488.

For the direct measuring probe evaluation, the DP clock cycle must be integer multiple of the position controller clock cycle.

<b>Description:</b>	Displays the dynamic following error. This value is the deviation, corrected by the velocity-dependent component, between the position setpoint and the position actual value.		
<b>Note:</b>	For p2534 >= 100 % (pre-control activated) the following applies: The dynamic following error (r2563) corresponds to the system deviation (r2557) at the position controller input. For 0 % < p2534 < 100 % (pre-control activated) or p2534 = 0 % (pre-control de-activated) the following applies: The dynamic following error (r2563) is the deviation between the measured position actual value and a value that is calculated from the position setpoint via a PT1 model. This compensates the system-related velocity-dependent system deviation for a P controller.

<b>Note:</b>	When calculating the torque pre-control value (r2654), the time derivation of the speed pre-control value is multiplied by 2 PI * p2567. For reasons associated with the compatibility to earlier firmware versions, the factory setting for p2567 = 1 kgm <sup>2</sup> /2 PI. This means that CO: r2564 remains as standard the derivation over time of the speed pre-control value and is referred, as before, to a moment of inertia of 1 kgm <sup>2</sup> /2 PI. SERVO_S110-DP (EPOS), SERVO_S110-CAN (EPOS), SERVO_S110-PN (EPOS)	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned32 <b>P-Group:</b> Basic positioner <b>Not for motor type:</b> - <b>Min</b> 1 [1000 LU/s <sup>3</sup> ]	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max</b> 100000000 [1000 LU/s <sup>3</sup> ]	<b>Access level:</b> 1 <b>Func. diagram:</b> 3635 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 10000 [1000 LU/s <sup>3</sup> ]
<b>Description:</b>	Sets the jerk limiting		
<b>Dependency:</b>	Refer to: p2572, p2573, p2575		
<b>Note:</b>	The jerk limiting is internally converted into a jerk time as follows: $\text{Jerk time } T_r = \max(p2572, p2573) / p2574$ The jerk time is internally limited to 1000 ms and is rounded-off to an integer multiple of the sampling time positioning (p0115[5]). The jerk time is valid for the acceleration and deceleration phases also for unequal maximum acceleration (p2572) and maximum deceleration (p2573). For unequal maximum acceleration and maximum deceleration, the motion is not optimal from a time perspective as the jerk limit cannot be used for the lower of the two values. If, in the traversing profile, the acceleration time without jerk limiting is less than the jerk time $T_r$ , then the motion with jerk limiting is not optimum from a time perspective. For traversing motion with a direct transition between acceleration and deceleration (i.e. jerk time is greater than the constant velocity phase), jerk can increase up to twice the parameterized jerk. CONTINUE_FLYING with direction reversal acts internally just like a CONTINUE_WITH_STOP without the "position reached" being set. Without jerk limiting, this behavior can hardly be noticed as, when reversing, the position setpoint is only kept at zero for one interpolator clock cycle. For block change enable CONTINUE_WITH_STOP, jerk limiting results in a longer delay time.

<b>Description:</b>	Sets the amount of play (backlash) for positive or negative play.		

0: The backlash compensation is de-activated.

> 0: Positive backlash (normal case)

When the direction is reversed, the encoder actual value leads the actual value.

< 0: Negative backlash

When the direction is reversed, the actual value leads the encoder actual value.

**Dependency:**

If a stationary axis is referenced by setting the reference point, or an adjusted with absolute encoder is powered up, then the setting of p2604 is relevant for entering the compensation value.

p2604 = 1:

Traveling in the positive direction -> A compensation value is immediately entered.

Traveling in the negative direction -> A compensation value is not entered

p2604 = 0:

Traveling in the positive direction -> A compensation value is not entered

Traveling in the negative direction -> A compensation value is immediately entered.

When again setting the reference point (a referenced axis) or for "flying referencing", p2604 is not relevant but instead the history of the axis.

**Description:** Sets the signal source to start the "search for reference" or "flying referencing".

BI: p2595 = 0/1 signal

Referencing is started.

BI: p2595 = 1/0 signal

Referencing is interrupted.

**Dependency:** Refer to: p2597, p2598, p2599, r2684

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** Search for reference (BI: p2597 = 0 signal):

The reference point approach can only be activated (0/1 edge) after traversing motion that is being processed has been completed.

With the start, where relevant, the state signal "reference point set" (r2684.11) is reset.

Flying referencing (BI: p2597 = 1 signal):

With the start, the state signal "reference point set" (r2684.11) is not reset.

<b>Description:</b>	Sets the approach velocity after detecting the reference cam to search for the zero mark for the search for reference.		
<b>Dependency:</b>	If there is no reference cam (p2607 = 0), the search for reference immediately starts with the axis traversing to the zero mark. Refer to: p2595, p2597, p2604, p2607, p2609, p2610		
<b>Caution:</b>	If the reference cam is not adjusted so that at each search for reference the same zero mark for synchronization is detected, then an "incorrect" axis reference point is obtained. After the reference cam has been left, the search for the zero mark is activated with a time delay due to internal factors. This is the reason that the reference cam should be adjusted in this center between two zero marks and the approach velocity should be adapted to the distance between two zero marks.		
			
<b>Note:</b>	The velocity override is not effective when traversing to the zero mark.

**Note:** To start a traversing block, the axis must be referenced (r2684.11 = 1).  
The status signal r2684.12 = 0/1 signal is used for acknowledgement.  
A traversing task can be influenced using the following signals:  
- intermediate stop via BI: p2640.  
- reject traversing task via BI: p2641.

1: External block change via BI: p2633

**Dependency:** Refer to: p2623, p2633, r2677, r2678

**Note:** In the mode "external block change via measuring probe (p2632 = 0), the following applies:  
When starting a traversing block with the block change enable CONTINUE\_EXTERNAL, CONTINUE\_EXTERNAL\_WAIT and CONTINUE\_EXTERNAL\_ALARM an activated "flying referencing" is interrupted. After ending the block, "flying referencing" must be re-activated via BI: p2595 = 0/1 signal.

**Description:** Sets the signal source for "external block change".

BI: p2633 = 0/1 signal

**Dependency:** The evaluation of the signal is only active p2632 = 1.

Refer to: p2623, p2632, p2640, p2641, r2677, r2678

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** A 0/1 edge initiates a flying block change in the subsequent traversing block.

When the external block change is identified, the actual position is saved in r2678.

A traversing task can be influenced using the following signals:

- intermediate stop via BI: p2640.
- reject traversing task via BI: p2641.

### 2.2 List of parameters

The following applies for "positioning":

Using binector inputs p2651 and p2652, when the modulo correction (BI: p2577 = 1 signal) is activated and for absolute positioning (BI: p2648 = 1 signal), the traversing direction is specified as follows:

BI: p2651 / BI: p2652

0 signal / 0 signal: Absolute positioning through the shortest distance.

1 signal / 0 signal: Absolute positioning in the positive direction.

0 signal / 1 signal: Absolute positioning in the negative direction.

1 signal / 1 signal: Absolute positioning through the shortest distance.

## 2 Parameters

### 2.2 List of parameters

All currents specified as relative value are referred to this reference quantity. The reference quantity in this parameter corresponds to 100% or 4000 hex or 4000 0000 hex.

This parameter has the unit Arms.

**Dependency:**

Refer to: p2002

**Note:**

This parameter provides the numerical value of the reference quantity p2002 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC.

**Description:**

Connector output of the reference quantity for powers p2004. All power ratings specified as relative value are referred to this reference quantity. The reference quantity in this parameter corresponds to 100% or 4000 hex or 4000 0000 hex. The unit of this parameter is the same as the unit selected for p2004.

**Dependency:**

This value is calculated as voltage x current for the infeed and as torque x speed for closed-loop controls.

Refer to: r2004

**Note:**

This parameter provides the numerical value of the reference quantity p2004 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC.

The reference power is calculated as follows:

-  $2 * \text{Pi} * \text{reference speed} / 60 * \text{reference torque (motor)}$

-  $\text{reference voltage} * \text{reference current} * \text{root}(3) \text{ (infeed)}$

<b>Description:</b>	Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.		
<b>Dependency:</b>	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking of the load gear (p2720.0 = 1).		
<b>Note:</b>	The resolution that is set must be able to be represented using r2723. For rotary axes/modulo axes, the following applies: This parameter is pre-set with p0421 and can be changed. For linear axes, the following applies: This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.

<b>Description:</b>	Sets a tolerance window for position tracking. After the system is powered up, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --> An appropriate message is output.		
<b>Dependency:</b>	Refer to: F07449		
<b>Caution:</b>	Rotation, e.g. through a complete encoder range is not detected.		
			
<b>Note:</b>	The value is entered in integer (complete) encoder pulses. For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).

<b>Description:</b>	Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning. p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning. The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1).		

p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 and the calculations corresponding to p0340 = 1.

p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1.

**Value:**  
 0: No quick parameterization  
 1: Quick parameterization after parameter reset  
 2: Quick parameterization (only) for BICO and motor parameters  
 3: Quick parameterization for motor parameters (only)

**Notice:** It is not possible to modify parameters after changing the value.

**Note:** When the calculations have been completed, p3900 and p0010 are automatically reset to a value of 0.

When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten.

If a catalog motor has not been selected (see p0300), then the following parameters are reset with p3900 > 0 in order to restore the situation that applied when commissioning the drive for the first time:

for induction motors p0320, p0352, p0353, p0604, p0605, p0626 ... p0628.

for synchronous motors p0326, p0327, p0352, p0353, p0391 ... p0393, p0604, p0605.

0	1000	2
---	------	---

**Description:** Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring.  
If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered.  
If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.

**Dependency:** Refer to: p0437, p4688  
Refer to: F31131

**Note:** This monitoring is activated by setting p0437.2 = 1 (position actual value correction).  
The positive limit describes additional pulses due to EMC.

-------	---	-------

**Description:** Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring.  
If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered.  
If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.

**Dependency:** Refer to: p0437, p4681, p4688  
Refer to: F31131

**Note:** This monitoring is activated by setting p0437.2 = 1 (position actual value correction).  
For a set value = -1001, the negated value of p4681 is effective.  
The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.

**Description:** Sets the positive tolerance window in encoder pulses for limit 2 for the zero mark monitoring.  
If the zero mark deviation is higher than the tolerance set in p4681 and p4682 and fault F3x131 is re-parameterized to alarm (A) or no message (N), the accumulator p4688 is compared with this parameter and, if applicable, alarm A3x422 is output for 5 seconds.

**Dependency:** Refer to: p0437, p4681, p4682, p4688  
Refer to: F31131, A31422

**Note:** Zero mark monitoring is activated by setting p0437.2 = 1 (position actual value correction).

<b>Description:</b>	Displays the trace buffer (record buffer) for trace 0 and signal 0. The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks. Example A: The first 16384 values of signal 0, trace 0 are to be read out. In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383]. Example B: The values 16385 to 32768 from signal 0, trace 0 are to be read out. In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383].

**Description:** Displays the trace buffer (record buffer) for trace 0 and signal 0 as integer number.

**Note:** For signals, data type I32 or U32, the trace buffer is assigned as follows:

r4760[0] = value 0

r4760[1] = value 1

...

r4760[8191] = value 8191

For signals, data type I16 or U16, the trace buffer is assigned as follows:

r4760[0] = value 0 (bit 31 ... 16) and value 1 (bit 15 ... 0)

r4760[1] = value 2 (bit 31 ... 16) and value 3 (bit 15 ... 0)

...

r4760[8191] = value 16382 (bit 31 ... 16) and value 16383 (bit 15 ... 0)

For signals, data type I8 or U8, the trace buffer is assigned as follows:

r4760[0] = value 0 (bit 31 ... 24) value 1 (bit 23 ... 16) value 2 (bit 15 ... 8) value 3 (bit 7 ... 0)

r4760[1] = value 4 (bit 31 ... 24) value 5 (bit 23 ... 16) value 6 (bit 15 ... 8) value 7 (bit 7 ... 0)

...

r4760[8191] = value 32764 (bit 31 ... 24) value 32765 (bit 23 ... 16) value 32766 (bit 15 ... 8) value 32767 (bit 7 ... 0)

**Description:**

Setting to adapt the file system on the non-volatile memory.

Example:

The result data "clamping cycle thresholds" are available (r5005.1 = 1) and should be reset.

-&gt; set p5007.1 = 1: select result data "clamping cycle thresholds".

-&gt; set p5009 = 1: initiate "reset" function for the file selected in p5007.

-&gt; p5009 = 40: feedback signal during "operation running".

-&gt; p5009 = 20: feedback signal for a successfully completed operation.

-&gt; p5009 = 51 ... 53: fault values if the operation was not able to be successfully completed.

-&gt; carry out a POWER ON (power off/on).

## 2 Parameters

	0	65535	0
<b>Description:</b>	Sets the priority for processing the existing drive objects in the system. The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check. With the factory setting the following priorities regarding processing are applicable: - The drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU-LINK - If they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.		
<b>Index:</b>	[0] = Drive object number Control Unit [1] = Drive object number object 1 [2] = Drive object number object 2 [3] = Drive object number object 3 [4] = Drive object number object 4 [5] = Drive object number object 5 [6] = Drive object number object 6 [7] = Drive object number object 7 [8] = Drive object number object 8 [9] = Drive object number object 9 [10] = Drive object number object 10 [11] = Drive object number object 11 [12] = Drive object number object 12 [13] = Drive object number object 13 [14] = Drive object number object 14 [15] = Drive object number object 15 [16] = Drive object number object 16 [17] = Drive object number object 17 [18] = Drive object number object 18 [19] = Drive object number object 19 [20] = Drive object number object 20 [21] = Drive object number object 21 [22] = Drive object number object 22 [23] = Drive object number object 23

<b>Note:</b>	If the same drive object numbers are used and if the existing drive object numbers in the system are entered incompletely, the content of this parameter is ignored entirely. The behavior as with factory setting will then become effective.

<b>Description:</b>	Displays the Pre-defined Error Field of the CAN node. It includes the number of all errors that have occurred, the number of errors that have occurred for each drive and the errors according to their history. The first 16 bits represent the CANopen error code and the second 16 bits the SINAMICS error code. Index 1 has the same structure - however, the drive object ID is in the second 16 bits instead of the SINAMICS error code. CANopen error code: 0000 hex: No error present 8110 hex: Alarm A08751 present 8120 hex: Alarm A08752 present 8130 hex: Alarm A08700(F) with alarm value = 2 present 1000 hex: Generic error 1 present (there is at least one fault outside the range 8700 ... 8799) 1001 hex: Generic error 2 present (there is at least one alarm in the range 8700 ... 8799 with the exception of A08751, A08752, A08700) All drive objects are acknowledged by writing the value 0 to the index 0. As soon as a fault has been acknowledged or an alarm cleared, then it is also cleared from the fault list.

<b>Description:</b>	Display or setting of the CANopen Node ID. The Node ID can be set as follows: 1) Using the address switch on the Control Unit. --> p8620 can then only be read and displays the selected Node ID. --> A change only becomes effective after a POWER ON. --> CANopen Node ID and PROFIBUS address are identical. 2) Using p8620 --> Only if address 0 is set using the address switch. --> the Node ID is set as standard to 126. --> A change only becomes effective after save and POWER ON.		
<b>Dependency:</b>	Refer to: r8621		
<b>Note:</b>	Every node ID change only becomes effective after a POWER ON. The active node ID is displayed in r8621. The parameter is not influenced by setting the factory setting. It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (prerequisite: the address 0 is set for the address switch).

Re bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

Re bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

<b>Note:</b>	Re bit 00: When the function is activated, a safety-relevant acknowledgement (internal event acknowledge) can be performed by selecting/deselecting STO.				
	Re bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.				
	Re bit 02: This bit defines the type of motor, which the sensorless safety technology evaluates. For bit = 0, the sensorless motion monitoring function calculates the actual velocity for an induction motor. For bit = 1, an actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300. Bit = 0 should be set if no motor is defined (p0300 = 0).

	250.0000 [µs]	8000.0000 [µs]	2000.0000 [µs]

**Description:** Sets the clock cycle time of the actual value sensing for safe motion monitoring.  
Setting criteria if the motion monitoring functions are executed with an encoder.  
- A slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.  
- The maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.  
- Setting criteria if the motion monitoring functions are executed without an encoder:  
- The actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p0115).

**Dependency:** Refer to: p0115, p9300, p9511  
Refer to: F01652

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1).  
The monitoring clock cycle from p9500 must be an integer multiple of this parameter.  
In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle.  
A factor of at least 8 is recommended. The value for the parameter must also be greater than or equal to 2 ms.  
A change only becomes effective after a POWER ON.

## 2 Parameters

### 2.2 List of parameters

[6] = Gearbox 7

[7] = Gearbox 8

**Dependency:**

Refer to: p9321

**Notice:**

It is not possible to change over the gearbox stages. Gearbox 1 (index 0) is always active.

**Note:**

In the case of encoderless monitoring functions, the pole pair number must be multiplied by the numerator of the gearbox ratio.

Example:

Gearbox ratio 1:4, pole pair number (r0313) = 2

--> p9321 = 1, p9322 = 8 (4 x 2)

## 2 Parameters

### 2.2 List of parameters

**Note:** SAM: Safe Acceleration Monitor (safe acceleration monitoring)  
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)  
For p9568 = p9368 = 0, the following applies:  
The value in p9546/p9346 (SSM) is applied as the velocity limit for SAM.

## 2 Parameters

### 2.2 List of parameters

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	Extended message acknowledgement	Yes	No	-
	01	Setpoint velocity limit for STOP F	No	Yes	-
	02	Motor type sensorless actual value sensing	Synchronous motor	Induction motor	-
<b>Dependency:</b>	Refer to: C01711				
<b>Note:</b>	Re bit 00: When the function is activated, a safety-relevant acknowledgement (internal event acknowledge) can be performed by selecting/deselecting STO.				
	Re bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.				
	Re bit 02: This bit defines the type of motor, which the sensorless safety technology evaluates. For bit = 0, the sensorless motion monitoring function calculates the actual velocity for an induction motor. For bit = 1, an actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300. Bit = 0 should be set if no motor is defined (p0300 = 0).

<b>Bit field:</b>	<b>Bit</b>	<b>Signal name</b>	<b>1 signal</b>	<b>0 signal</b>	<b>FP</b>
	00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-

**Dependency:** Refer to: C01711

**Note:** SDI: Safe Direction (safe motion direction)  
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)  
Re bit 00:  
For bit = 1 and with the SSM safety function activated, the following applies:  
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.  
For bit = 0 and with the SSM safety function activated, the following applies:  
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.  
Re bit 08:  
For bit = 1 and with the SDI safety function activated, the following applies:  
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.  
For bit = 0 and with the SDI safety function activated, the following applies:  
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

#### p9510 SI Motion clock-cycle synchronous PROFIBUS master / SI Mtn sync master

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1	0

**Description:** Setting for clock cycle synchronous communication between PROFIdrive controller and Control Unit.  
The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 = 1 ).

If a PROFIdrive controller exchanges process data in clock cycle synchronism with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data in clock cycle synchronism.

Examples for clock cycle synchronous communication:

- clock-cycle synchronous control for the motion control (e.g. SIMOTION).
- clock-cycle synchronous PROFIsafe master (e.g. SIMATIC S7-400F).

**Value:** 0: Communication not isochronous  
1: Communication isochronous

**Dependency:** Refer to: C01711, A01796

**Notice:** As of firmware version 2.6, the parameter has no effect.

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.2500 [ms]	8.0000 [ms]	2.0000 [ms]

**Description:** Sets the clock cycle time of the actual value sensing for safe motion monitoring. Setting criteria if the motion monitoring functions are executed with an encoder.

- A slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- The maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- Setting criteria if the motion monitoring functions are executed without an encoder:
- The actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p0115).

**Dependency:** Refer to: p0115  
Refer to: F01652

**Note:** The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1). The monitoring clock cycle from p9500 must be an integer multiple of this parameter. In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended. The value for the parameter must also be greater than or equal to 2 ms. A change only becomes effective after a POWER ON.

**Description:** This is an evaluation factor to define the setpoint limit from the selected actual speed limit.

The active SLS limit value is evaluated with this factor and is made available as setpoint limit in r9733.

**Dependency:** This parameter only has to be parameterized for the motion monitoring functions integrated in the drive (p9601.2 = 1)  
r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side)  
r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side)  
[x] = Selected SLS stage

Conversion factor from the motor side to the load side:

- motor type = rotary and axis type = linear: p9522 / (p9521 x p9520)

- otherwise: p9522 / p9521

Refer to: p9501, p9531, p9601

**Note:** The active actual speed limit is selected via safety-relevant inputs (SGE).

When selecting SOS or a STOP A ... D, setpoint 0 is specified in r9733.

**Description:** Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

**Description:** Sets the enable signal for the "Safe Brake Control" (SBC) function on processor 1.

**Value:**  
 0: Inhibit SBC  
 1: Enable SBC

**Dependency:** Refer to: p9802

**Note:** The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0).  
 It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.  
 It does not make sense to parameterize "motor holding brake the same as sequence control, connection via BICO" and enable "Safe Brake Control" (p1215 = 3, p9602 = p9802 = 1).  
 It is not permissible to parameterize "motor holding brake without feedback signals" and enable "Safe Brake Control" (p1278 = 1, p9602 = p9802 = 1).

<b>Description:</b>	Sets the debounce time for the digital input used to control STO/SBC/SS1.		
<b>Note:</b>	The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the fail-safe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

<b>Description:</b>	Sets the delay time of the pulse suppression for the "Safe Stop 1" (SS1) function on processor 1 to brake along the OFF3 down ramp (p1135).		
<b>Recommendation:</b>	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time $\geq$ p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time $\geq$ p1135 + p1228		

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p1135, p9852  
**Note:** For a crosswise data comparison between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated.  
 The parameterized time is rounded internally to an integer multiple of the monitoring clock cycle.  
 SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
	- [rpm]	- [rpm]	- [rpm]	
<b>Description:</b>	Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions. Contrary to the parameterization of the SI limit values, this parameter specifies the motor-side limit value and not the load-side limit value.			
<b>Index:</b>	[0] = Setpoint limiting positive [1] = Setpoint limiting negative [2] = Setpoint limit absolute			
<b>Dependency:</b>	For SLS: $r9733[0] = p9531[x] \times p9533$ (converted from the load side to the motor side) For SDI negative: $r9733[0] = 0$ For SLS: $r9733[1] = -p9531[x] \times p9533$ (converted from the load side to the motor side) For SDI positive: $r9733[1] = 0$ [x] = Selected SLS stage Conversion factor from the motor side to the load side: - motor type = rotary and axis type = linear: $p9522 / (p9521 \times p9520)$ - otherwise: $p9522 / p9521$ Refer to: p9531, p9533			
<b>Notice:</b>	If $p1051 = r9733[0]$ is interconnected, $p1052 = r9733[1]$ must also be interconnected. If only the absolute value of the setpoint velocity limiting is required, $r9733[2]$ must be interconnected.			
<b>Note:</b>	The unit changeover between linear and rotary axis is not implemented via the safety changeover (p9502) but by the linear motor changeover. If the "SLS" or "SDI" function is not selected, $r9733[0]$ shows $p1082$ and $r9733[1]$ shows $-p1082$ . The display in $r9733$ can be delayed by up to one Safety monitoring clock cycle as compared to the display in $r9719/r9720$ and $r9721/r9722$ .

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-50.00 [%]	0.00 [%]	-20.00 [%]
<b>Description:</b>	Sets the field-generating current for sensorless actual value sensing of synchronous motors. For synchronous motors, this current is fed in using sensorless safety functions. The value must fulfill the following condition: $ p0305 \times p9783  \geq p9588 \times 1.2$		
<b>Dependency:</b>	Refer to: p9588 Refer to: C01711		
<b>Notice:</b>	Reducing this percentage value can adversely affect actual value sensing with synchronous motors. If the value is increased, this results in an increased motor power loss.		
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9306/p9506 = 1).

<b>Description:</b>	Sets the enable signal for the "Safe Brake Control" (SBC) function on processor 2. 0: Inhibit SBC 1: Enable SBC			
<b>Dependency:</b>	Refer to: p9602			
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
<b>Note:</b>	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0). It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake. It does not make sense to parameterize "motor holding brake the same as sequence control, connection via BICO" and enable "Safe Brake Control" (p1215 = 3, p9602 = p9802 = 1). It is not permissible to parameterize "motor holding brake without feedback signals" and enable "Safe Brake Control" (p1278 = 1, p9602 = p9802 = 1). SBC: Safe Brake Control

<b>Description:</b>	Sets the tolerance time for the changeover of the safety-related inputs on processor 2. An F-DI changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an F-DI changeover, dynamic data is not subject to a crosswise data comparison during this tolerance time.

<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
<b>Note:</b>	The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the fail-safe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. <b>Description:</b>	Sets the delay time of the pulse suppression for the "Safe Stop 1" (SS1) function on processor 2 to brake along the OFF3 down ramp (p1135).		
<b>Recommendation:</b>	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time $\geq$ p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time $\geq$ p1135 + p1228		
<b>Dependency:</b>	Refer to: p1135, p9652

**Description:**

If, when comparing the actual topology and target topology, only error has occurred, that can be acknowledged, then using this parameter, a new comparison can be started - acknowledging the error in the target topology.

Differences that can be acknowledged:

- topology comparison, component shifted
- topology comparison, serial number of a component has been detected to be different (byte 3 = 1)
- topology comparison shows one component that is connected differently

The following parameter values are available:

p9904 = 1 --> the procedure is started.

p9904 = 0 after starting --> the procedure has been successfully completed.

p9904 = 1 after starting --> the procedure has not been successfully completed.

The possible causes for an unsuccessful procedure are located in bytes 4, 3, 2.

Byte 2:

Number of structural differences.

Byte 3:

Number of differences that can be acknowledged (p9904).

Byte 4:

Number of differences. These differences can be resolved as follows:

- sets the topology comparison (p9906 or p9907/p9908).
- change over the actual topology.

The appropriate action should be selected corresponding to the message that is displayed/output.

**Note:**

In order to permanently accept the acknowledgement of the fault that can be resolved, then it must be saved in a non-volatile fashion (p0977).

**Description:**

With p9905 = 1, the serial numbers and the hardware versions of all of the components are transferred from the actual topology into the target topology and a new comparison is started.

For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers.

## 2 Parameters

### 2.2 List of parameters

With p9905 = 2, the serial numbers, the hardware versions and the order numbers of all of the components are transferred from the actual topology into the target topology and a new comparison is started.

For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers and order numbers.

**Note:** p9905 is automatically set to 0 at the end of the operation.

In order to permanently accept the data, it is necessary to save in a non-volatile fashion (p0977).

Index 8 = license key character 9 (e.g. 65 dec)

Index 9 = license key character 20 (e.g. 0 dec)

...

With the STARTER commissioning software, ASCII characters are not entered coded, i.e. the characters of the license key can be entered as printed in the Certificate of License. In this case, STARTER codes the characters.

**Dependency:**

Refer to: r7843, p9921

Refer to: A13000, A13001, F13010

**Notice:**

An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

**Note:**

If there is not a valid license key present, all the indices have the value 0 dec.

Only the ASCII characters, contained in a license key can be entered.

When changing p9920[x] to the value 0 dec, all the values of all the following indices are also set to 0 dec.

After entering the license key, the license key must be activated (p9921).

If the licensing is not adequate, then the following alarm is displayed together with LED:

- A13000 --> licensing not sufficient

- LED READY --> flashes green/red with 0.5 Hz

The following is executed when activating the license key.

- the checksum of the entered license key is checked.

- the entered license key is saved in a non-volatile fashion on the memory card.

- re-enter the license key.

**Dependency:**

Refer to: p9920

Refer to: A13000, A13001, F13010

**Note:**

Before activation, the license key entered using parameter p9920 is checked. If this check identifies an error, activation is rejected. In this case, writing a 1 to p9921 is rejected.

When the license key has been activated, p9921 is automatically set to 0.

## 2 Parameters

### 2.2 List of parameters

The debounce time acts on the following digital inputs:

- Fail-safe digital inputs (F-DI).
- Single-channel digital inputs (DI).
- Single-channel digital input 22 (DI 22, read back input for the forced checking procedure).

**Dependency:**

Refer to: p10117

**Note:**

Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

The debounce result can be read in r10051.

<b>Note:</b>	If a safety function is assigned to an input (e.g. via p10022), then the following applies: - logical "0": Safety function is selected - logical "1": Safety function is de-selected The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function: With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level. This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function. With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level. This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function. F-DI: Failsafe Digital Input The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051. The parameter is only updated in the following cases: - If the Safety Extended Functions are enabled by means of activation via F-DI. - If transfer of the F-DIs via PROFIsafe is enabled (see p9501). In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p9501, p9601, p10117, p10140

**Note:** F-DI: Failsafe Digital Input

If a safety function is assigned to an input (e.g. via p10122), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10140) of the input as either NC or NO contact and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- If the Safety Extended Functions are enabled by means of activation via F-DI.
- If transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

**Dependency:**

Refer to: r20008

**Caution:**

The assignment of the properties of the run-time groups should not be changed on drives in operation as this could result in discontinuous signal transitions depending on the blocks used. At the 1st arithmetic cycle after the change, the respective internal initialization value is present at the block connections and in each subsequent cycle the calculated value is then present.

**Note:**

Re value = 1 ... 256:

This value can only be set if, for sampling time  $T_{\text{sample}}$  of this run-time group, the following applies:  $1 \text{ ms} \leq T_{\text{sample}} \leq r20003$ .

If value = 9003:

The fixed run-time groups  $p20000[x] = 9003$  log on with the sampling time of the setpoint channel, although the sampling time must be at least 1 ms. If, as a result of this limit, the actual sampling time deviates from the sampling time of the setpoint channel  $p0115[3]$ , alarm A20103 is output. Another run-time group with a sampling time  $\geq 1 \text{ ms}$  should be selected. "Calculate before setpoint channel" means before function diagrams 3010, 3020, 3030, 3040, etc. are calculated, if the setpoint channel is activated ( $p0108.8 = 1$ ). If, e.g. for SERVO, a setpoint channel has not been configured ( $p0108.8 = 0$ ), then the calculation is made before function diagram 3095.

### r20008[0...12] Hardware sampling times available / HW t\_samp

SERVO_S110-DP (FBLOCKS), SERVO_S110-CAN (FBLOCKS), SERVO_S110-PN (FBLOCKS)	<b>Can be changed:</b> -	<b>Calculated:</b> -	<b>Access level:</b> 3

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [ms]	- [ms]	- [ms]

**Description:** Displays the assignment of the available hardware sampling times of the drive unit.  
 The term "hardware sampling times" refers to those  $r20002$  sampling times that are formed as a multiple of the basic sampling time and always  $< r20003$ .

**Dependency:** Refer to:  $p20000$

**Notice:** For internal purposes, the drive unit always requires at least two (or several, depending on the parameterization of  $p0115$  of the drive objects) free hardware sampling times. Therefore the current number of hardware sampling times that are still free can be read out in  $r7903$ .

If  $r7903=0$ , no additional sampling time that differs from  $r20008[0...12]$  can be provided from the Control Unit. If, when selecting in this state, a run-time group with a sampling time  $< r20003$  ( $p20000 \leq 255$ ) is to be set in  $p20000$ , only run-time groups whose sampling time is already provided in  $r20008[0...12]$  can be selected.

**Note:** The 13 different sampling times available are displayed in  $r20008[0...12]$ .

If the value of  $r20008[0...12]$  is not equal to 0, then it specifies the sampling time in ms.

A sampling time that is provided can be simultaneously used by system functions, several FBLOCKS run-time groups, and several DCC run-time groups.

If the value of  $r20008[0...12] = 0$ , then this sampling time can still be freely assigned. It should be noted that the basic system, depending on the selected basic sampling times  $p0115[0]$ , requires at least two (sometimes several) freely assignable hardware sampling times for internal functions. The number of hardware sampling times that can still be freely assigned can be read out in  $r7903$ .

$r20008[11] = 99999.00000$  --> Hardware sampling time is not supported.

$r20008[12] = 99999.00000$  --> Hardware sampling time is not supported.

The sampling time of run-time groups that have been assigned to the PROFIBUS run-time groups ( $p20000 = 4000 \dots 4004$ ) is not displayed in  $r20008$ . For this sampling time, one of the internally and permanently assigned hardware sampling times is used.

The following list contains the parameters that are dependent on the encoder data sets.

Product: S110, Version: 4403900, Language: eng, Type: EDS

p0141[0...n]	Encoder interface (Sensor Module) component number / Enc_interf comp_no
p0142[0...n]	Encoder component number / Encoder comp_no
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0145[0...n]	Activate/de-activate encoder interface / Enc_intf act/deact
r0146[0...n]	Encoder interface active/inactive / Enc_intf act/inact
r0147[0...n]	Sensor Module EEPROM data version / SM EEPROM version
r0148[0...n]	Sensor Module firmware version / SM FW version
p0400[0...n]	Encoder type selection / Enc_typ sel
p0401[0...n]	Encoder type OEM selection / Enc type OEM sel
p0404[0...n]	Encoder configuration effective / Enc_config eff
p0405[0...n]	Square-wave encoder track A/B / Sq-wave enc A/B
p0408[0...n]	Rotary encoder pulse number / Rot enc pulse No.
p0410[0...n]	Encoder inversion actual value / Enc inv act value
p0414[0...n]	Redundant coarse position value relevant bits (identified) / Relevant bits
p0415[0...n]	Gx_XIST1 Coarse position safe most significant bit (identified) / Gx_XIST1 safe MSB
p0418[0...n]	Fine resolution Gx_XIST1 (in bits) / Enc fine Gx_XIST1
p0419[0...n]	Fine resolution absolute value Gx_XIST2 (in bits) / Enc fine Gx_XIST2
p0421[0...n]	Absolute encoder rotary multiturn resolution / Enc abs multiturn
p0423[0...n]	Absolute encoder rotary singleturn resolution / Enc abs singleturn
p0425[0...n]	Encoder rotary zero mark distance / Enc rot dist ZM
p0426[0...n]	Encoder zero mark differential distance / Enc ZM Dif_dist

The following list contains the parameters that are dependent on the power unit data sets.

Product: S110, Version: 4403900, Language: eng, Type: PDS

p0121[0...n]	Power unit component number / PU comp_no
r0127[0...n]	Power unit version EPROM data / PU EPROM version
r0128[0...n]	Power unit firmware version / PU FW version
r0200[0...n]	Power unit code number actual / PU code no. act
p0201[0...n]	Power unit code number / PU code no
r0203[0...n]	Actual power unit type / PU actual type
r0204[0...n]	Power unit hardware properties / PU HW property
p0251[0...n]	Operating hours counter power unit fan / PU fan t_oper

<b>Data sets</b>		<b>Information on parameters, binectors, connectors</b>					
Symbol	Meaning	Symbol	Meaning				
pxxxx[C]	Parameter belongs to the Command Data Set (CDS).	Parameter name	Parameter name (up to 18 characters)				
pxxxx[D]	Parameter belongs to the Drive Data Set (DDS).	[Unit]	[dimension unit]				
pxxxx[E]	Parameter belongs to the Encoder Data Set (EDS).	rxxx[y] or rxxx[y...z] or rxxx[y].ww or rxxx.ww	"r" = monitoring parameter. These parameters are read-only "xxxx" stands for the parameter number "y" specifies the valid index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[M]	Parameter belongs to the Motor Data Set (MDS).	pxxxx[y] or pxxxx[y...z] or pxxx[y].ww or pxxx.ww	"p" = setting parameter. These parameters can be changed. "xxxx" stands for the parameter number, "y" specifies the applicable index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[P]	Parameter belongs to the Power unit Data Set (PDS).	from ... to	Value range.				
		(xxxx[y].ww)	Parameter number (xxxx) with Index number [y] and bit number .ww.				
		(Def)	Factory setting.				
		(Def.w)	Factory setting with bit number as prefix.

Symbol	Meaning						
pxxxx	pxxxx = Original parameter of signal						
[aaaa.b]	aaaa = Signal comes from source diagram aaaa						
	b = Signal comes from signal path b						
		<b>Samplings times</b>					
Symbol	Meaning						
ZZZ.ZZ µs	Fixed time slice.						
PROFIdrive sampling time	According to presetting in p2048. (In synchronous mode, bus clock is valid.)						
CAN bus sampling time	According to presetting in p2048.						
Background	There is no fixed sampling time for this function. The processing takes place in background. The cycle time depends on the computational load of the control unit.

Fig. 3-4 1030 – Handling BICO technology

### Handling BICO technology

**Binector:**  r0723.15 Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

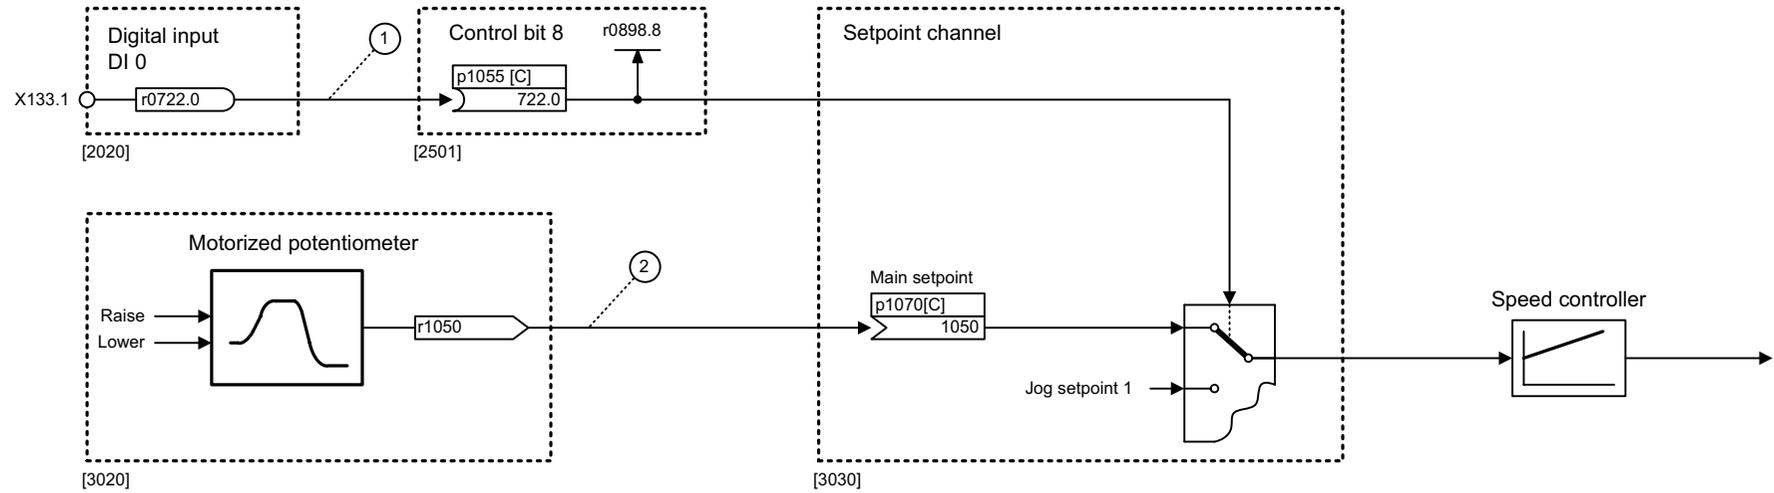

**Connector:**  r0723 Connectors are "analog signals" that can be freely interconnected (e.g. percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

**Parameterization:**

At the signal destination, the required binector or connector is selected using appropriate parameters:  
 "Bi:" parameter for binectors (Bi = Binector Input)  
 or  
 "Ci:" parameter for connectors (Ci = Connector Input)

**Example:**

The main setpoint for the speed controller (Ci: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (Bi: p1055) from digital input DI 0 (BO: r0722.0, X133.1 terminal) on the CU305.

**Parameterizing steps:**

- ① p1055[0] = 722.0 Terminal X133.1 acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

- <1> In order to maintain the PROFdrive profile, receive word 1 must be used as control word (STW1) (due to bit 10 "control requested").
- <2> Using the connector-binector converters, the bits can be extracted from two of the PZD receive words 5 to 20 and used as binectors.
- <3> The following representation applies for words: 4000 hex = 100 % for double words 4000 0000 hex = 100 %.  
The reference variables p200x apply for the ongoing interconnection (100 % -> p200x).  
The following applies for temperature values: 100 °C -> 100 % = 4000 hex or 4000 0000 hex; 0 °C -> 0 %.
- <4> The number of PZD receive words depends on the drive object type.
- <5> The connector-binector converter only converts the lower 16 bits irrespective of the input variable.
- <6> Every PZD word can be assigned a word or a double word. Only one of the 2 interconnection parameters r2050 or r2060 may have a value ≠ 0 for a PZD word.

- <1> To comply with the PROFdrive profile, send word 1 must be used as status word 1 (ZSW1), not as DWORD.
- <2> Every PZD word can be assigned a word or a double word. Only one of the 2 interconnection parameters p2051 or p2061 may have a value ≠ 0 for a PZD word.
- <3> Physical word and double word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex or 4000 0000 hex in the case of double words, if the input variable has the value p200x).  
The following applies for temperature values: 100° C -> 100 % = 4000 hex or 4000 0000 hex; 0° C -> 0 %.

<6> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.

<7> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or power-on inhibit).  
r0046.21 = 1, if p0858 = 1 or p0856 = 0.

The signal generation is shown simplified.

<8> The internal signal includes signals that lead to OFF1 or OFF3 (e. g. BICO or fault response).

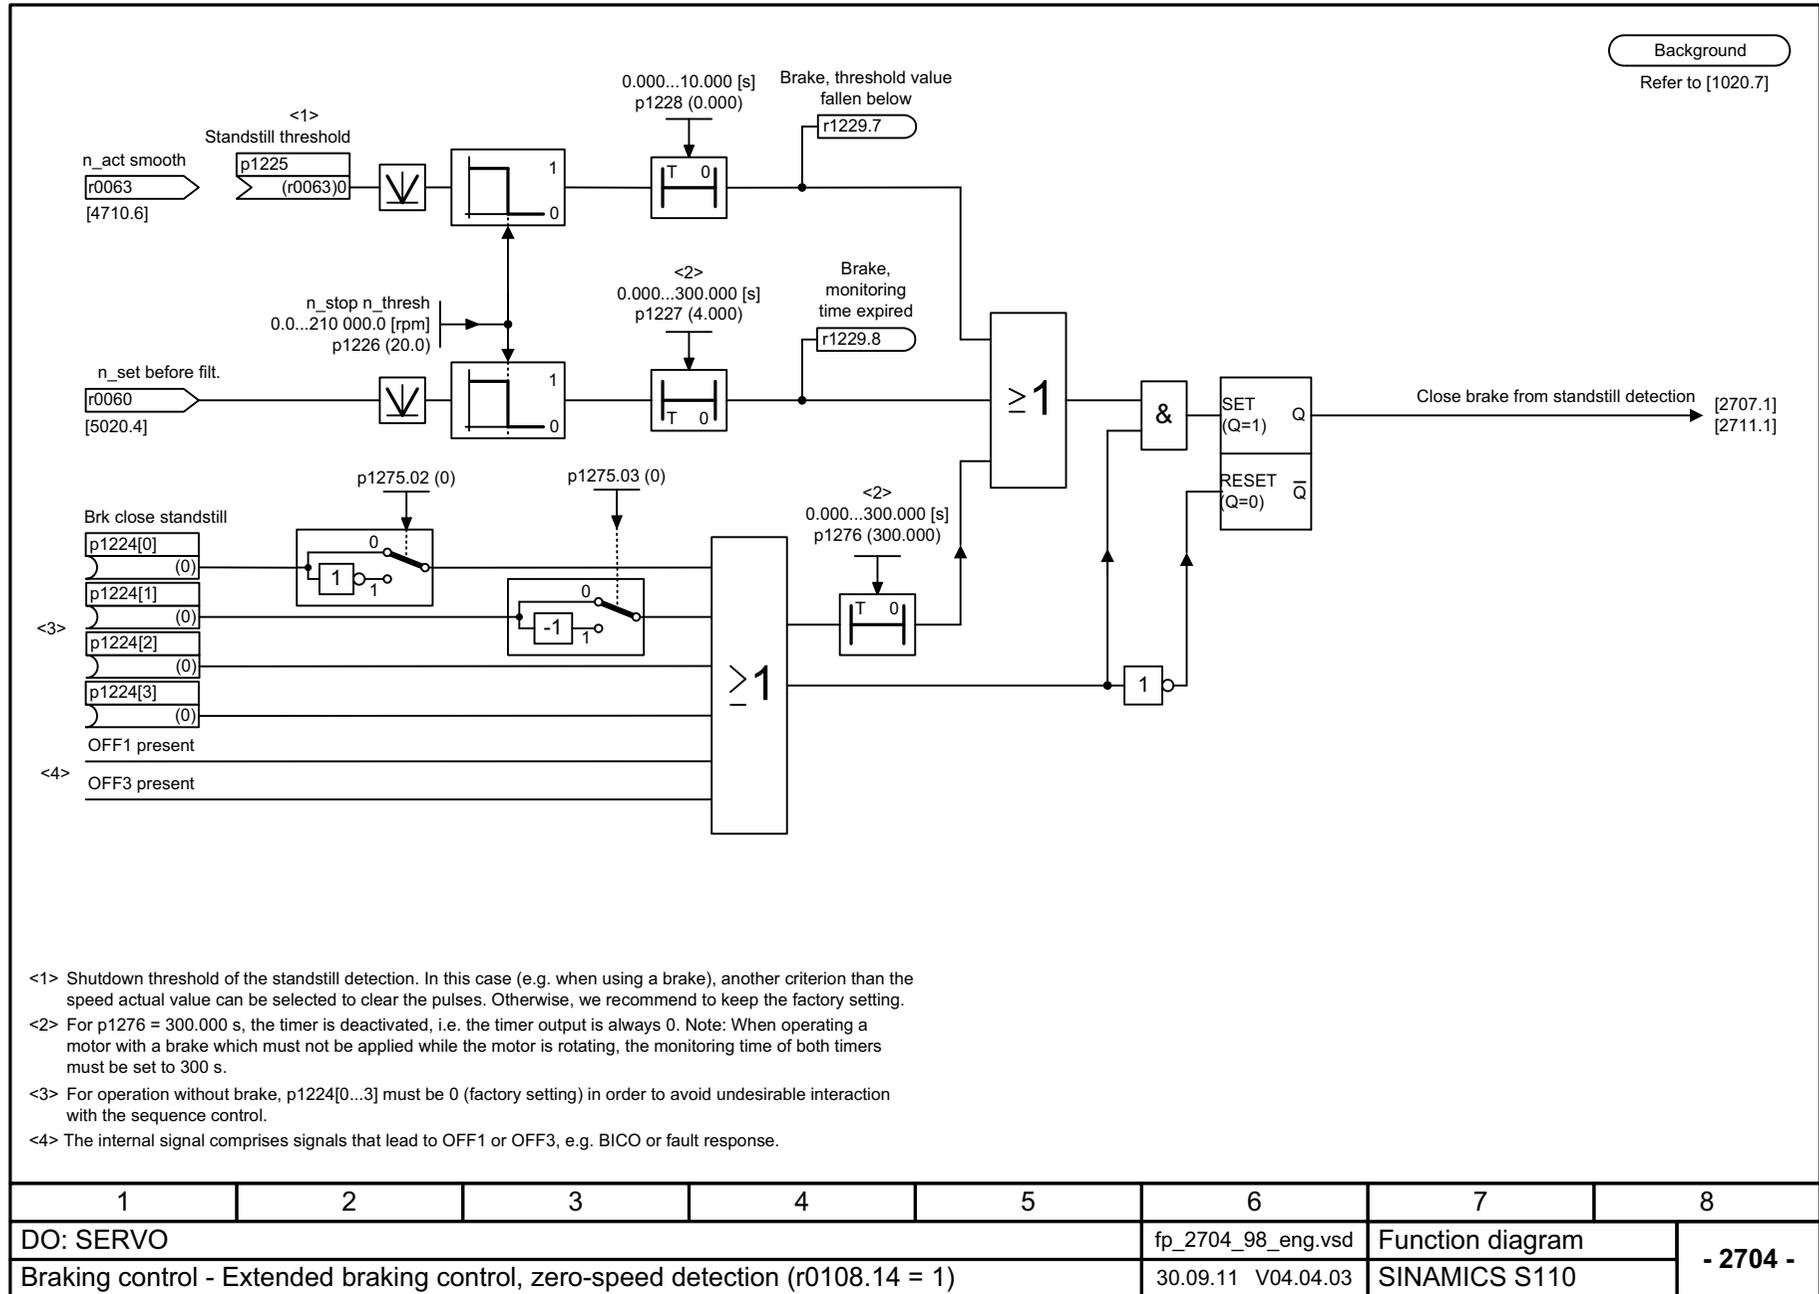

<9> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait while the brake is released or applied.

Note: Braking signal diagnostic evaluation (p1278) only applies for SBC (Safe Brake Control) (controls the Safe Brake Relay).

<1> For automatic commissioning, p1037 and p1038 are set to the maximum motor speed or to the rated motor speed, provided that n\_max\_mot has not been specified.  
 <2> If initial rounding-off is active (p1030.2 = 1), the selected ramp-up/down times are exceeded accordingly.  
 <3> Only effective if p1030.0 = 0.

<1> A suppression speed of "0" de-activates the suppression speed bandwidth.  
 <2> The setting range of p1082 is limited to n\_max\_mot.  
 <3> If the drive is not stopped via the input setpoint, but via controlled intervention, the lower hysteresis branch is relevant after a subsequent run-up.  
 <100> For SERVO, the following applies: Only if the function module "Extended setpoint channel" is activated (r0108.8 = 1). For r0108.8 = 0, [3095] applies for the generation of the speed limits.

- <1> For p1145 > 0, ramp-function generator tracking is activated when the torque limiting responds. This means that the speed controller output only exceeds the torque limit by a deviation that can be set via p1145.
- <2> For OFF1/OFF3, the ramp-function generator ramp is active. The ramp-function generator is set to the actual value and stops the drive with the ramp-downtime (p1121 or p1135). STW1.4 (enable ramp-function generator) is effective while the drive is stopped via the ramp-function generator. Depending on the p1115, the basic ramp-function generator [3060] or the extended ramp-function generator [3070] is effective. When the function module "extended setpoint channel" (r0108.8 = 0) is not active for OFF1/OFF3, the down ramp of the basic ramp-function generator is effective (refer to n\_set\_4 on [3060.8]).
- <3> The interpolator is only effective for clock-cycle synchronous PROFIBUS operation and sign-of-life received from the master (STW2.12 ... STW2.15).
- <4> Behavior of the response ramp of the torque limiting:  
p1145 = 0.0: No ramp-function generator tracking. The ramp-function generator ramp is no longer in the range of the speed actual value.  
p1145 = 1.0: The ramp-function generator ramp remains as close as possible to the speed actual value.  
p1145 > 1.0: The ramp-function generator ramp is steeper than for p1145 = 1.0 (higher "speed following error").
- <5> For SERVO, the following applies: Only when the function module "extended setpoint channel" is activated (r0108.8 = 1).
- <6> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).

p1400.10 = 1 is recommended if a torque pre-control signal is also connected at [5060] in addition to the speed pre-control signal.
- <4> The interpolator is only effective for clock-cycle synchronous PROFIdrive operation and sign-of-life received from the master (STW2.12 ... STW2.15).
- <5> For a 1/0 edge from control command STW2.8 "travel to fixed stop" [2444] the output of all filters is set to the input value for an instantaneous response to a change of the speed setpoint sign.
- <6> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).

<1> Torque control can only be activated for operation with encoder.

A related message is output if:

- 1) Sensorless operation is active and closed-loop torque control is requested (r1406.12 = 0 → 1).
- 2) Torque control is active and n\_act smooth > p1404.

<2> Automatic changeover to sensorless operation (e.g. for extremely high-speed spindle drives).

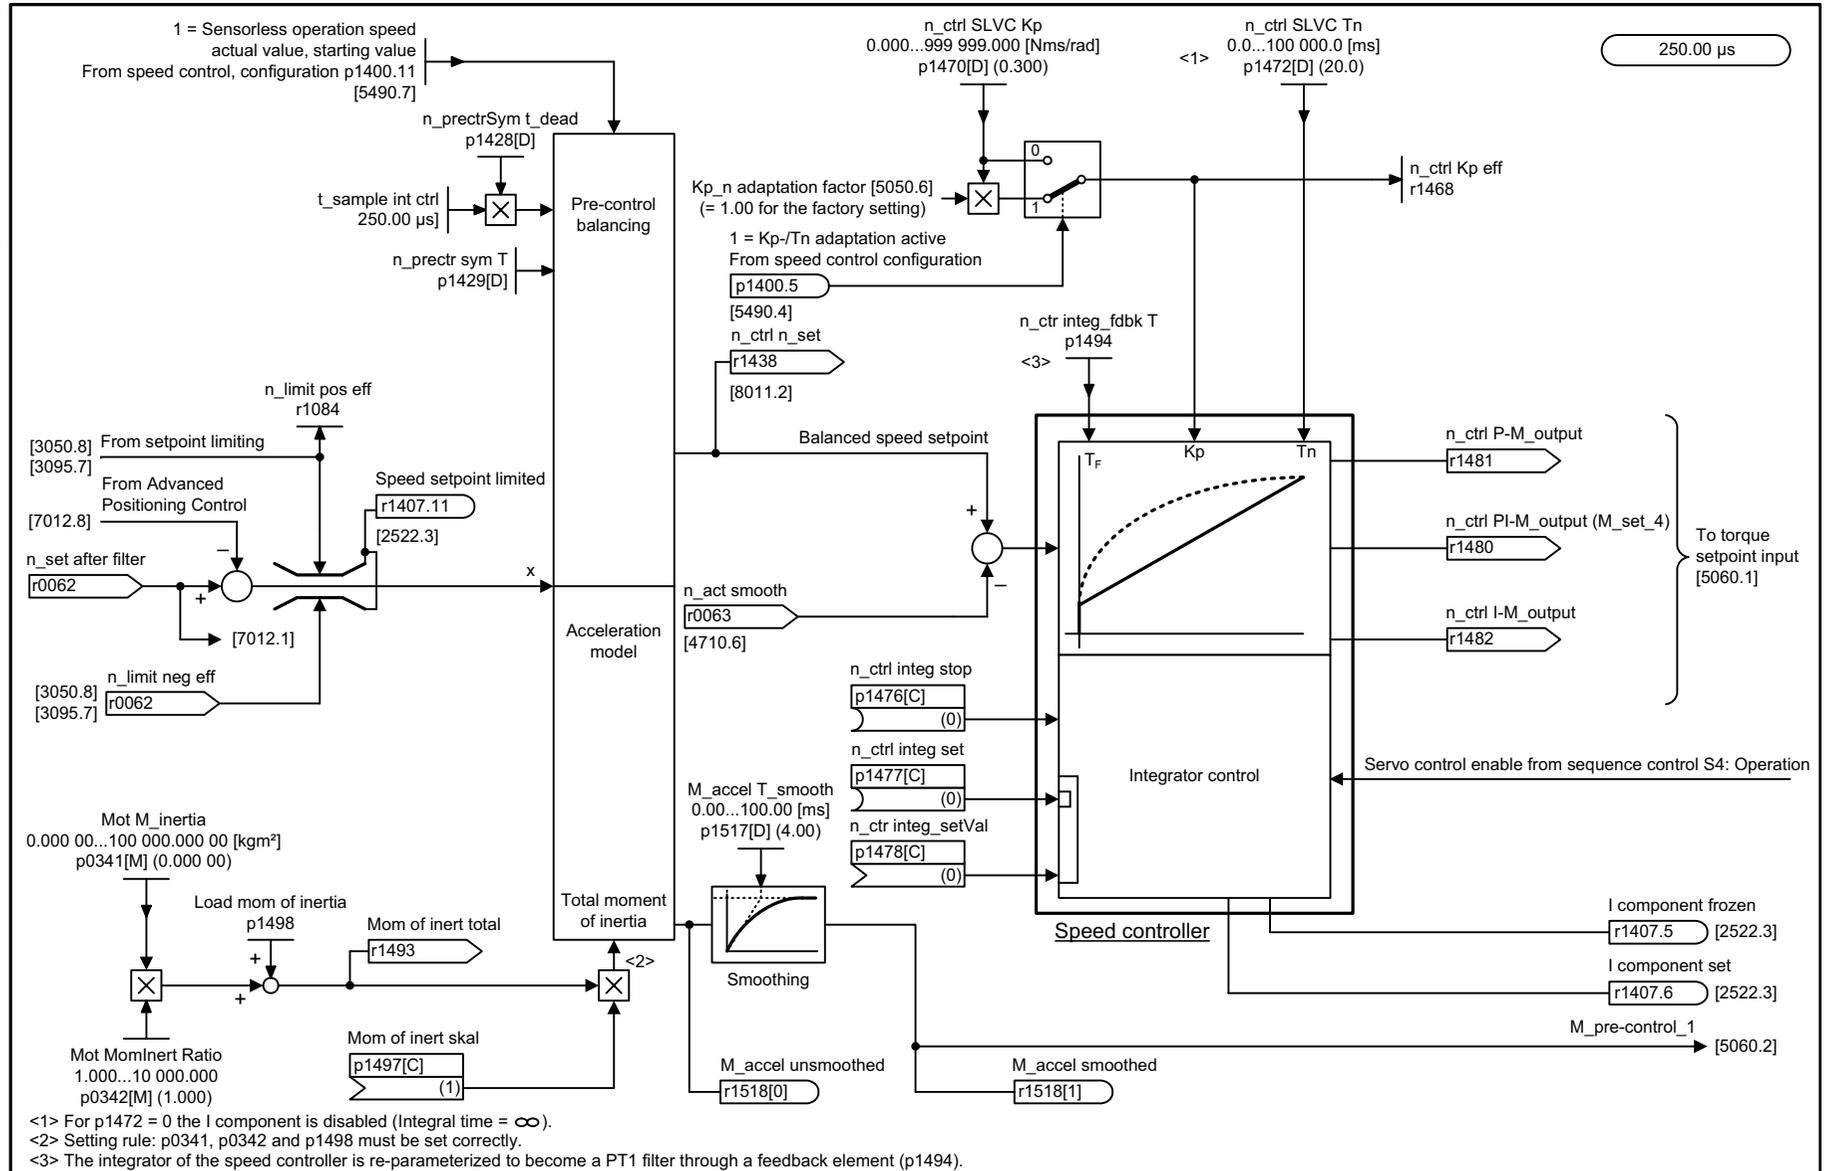

<3> When the pulses are canceled, r1509 is set to 0.

<4> Only if control priority is with control panel with speed setpoint input.

General

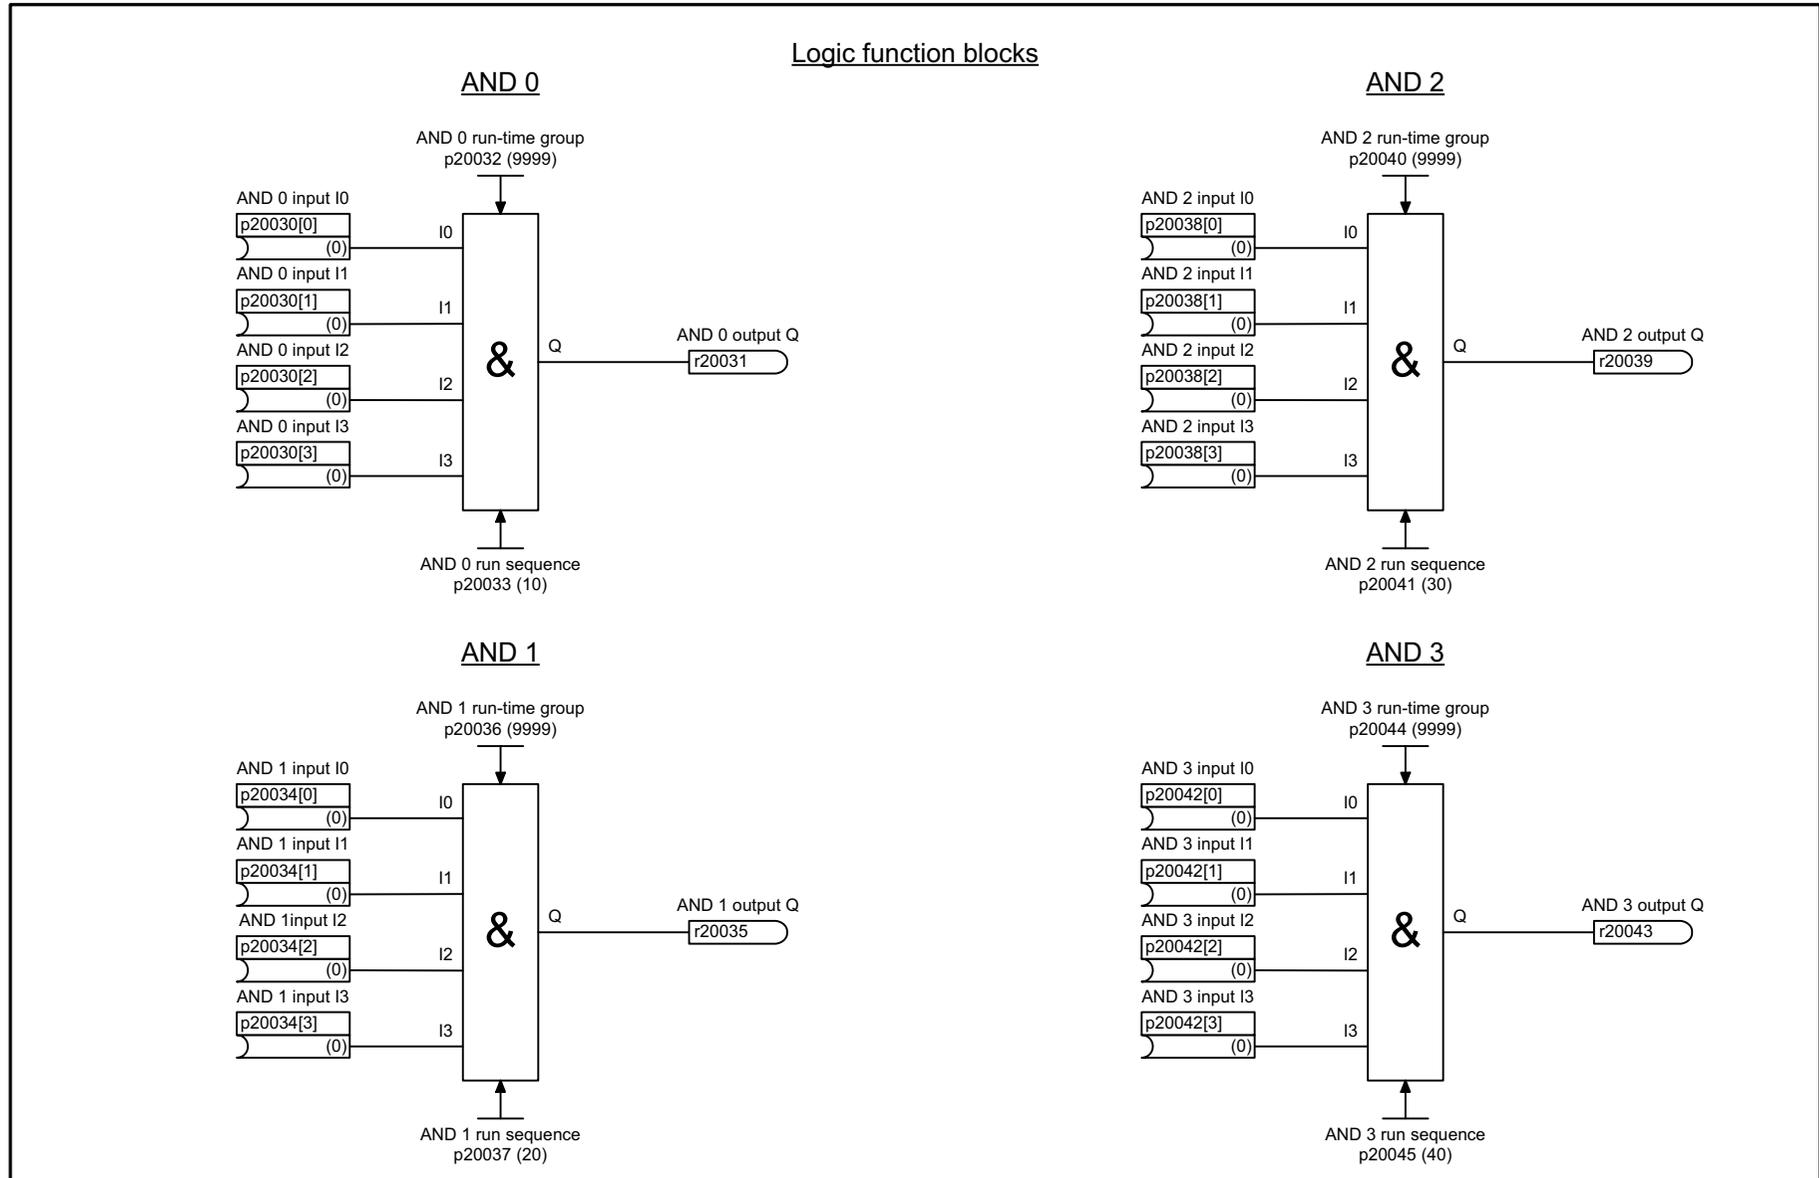

<1> The "free function blocks" function is activated in a drive object via p0108[DO\_No].18 = 1 (bit 18 = 1, corresponds to 40000 hex).

<2> The run-time group that belongs to a function block is entered, for every function block, in the particular parameter for the run-time group (e.g. p20032 for AND 0 to [7210]).

Changing the message type - fault <==> alarm for maximum 20 faults/alarms <1>

Changing the acknowledge mode for maximum 20 faults <1>

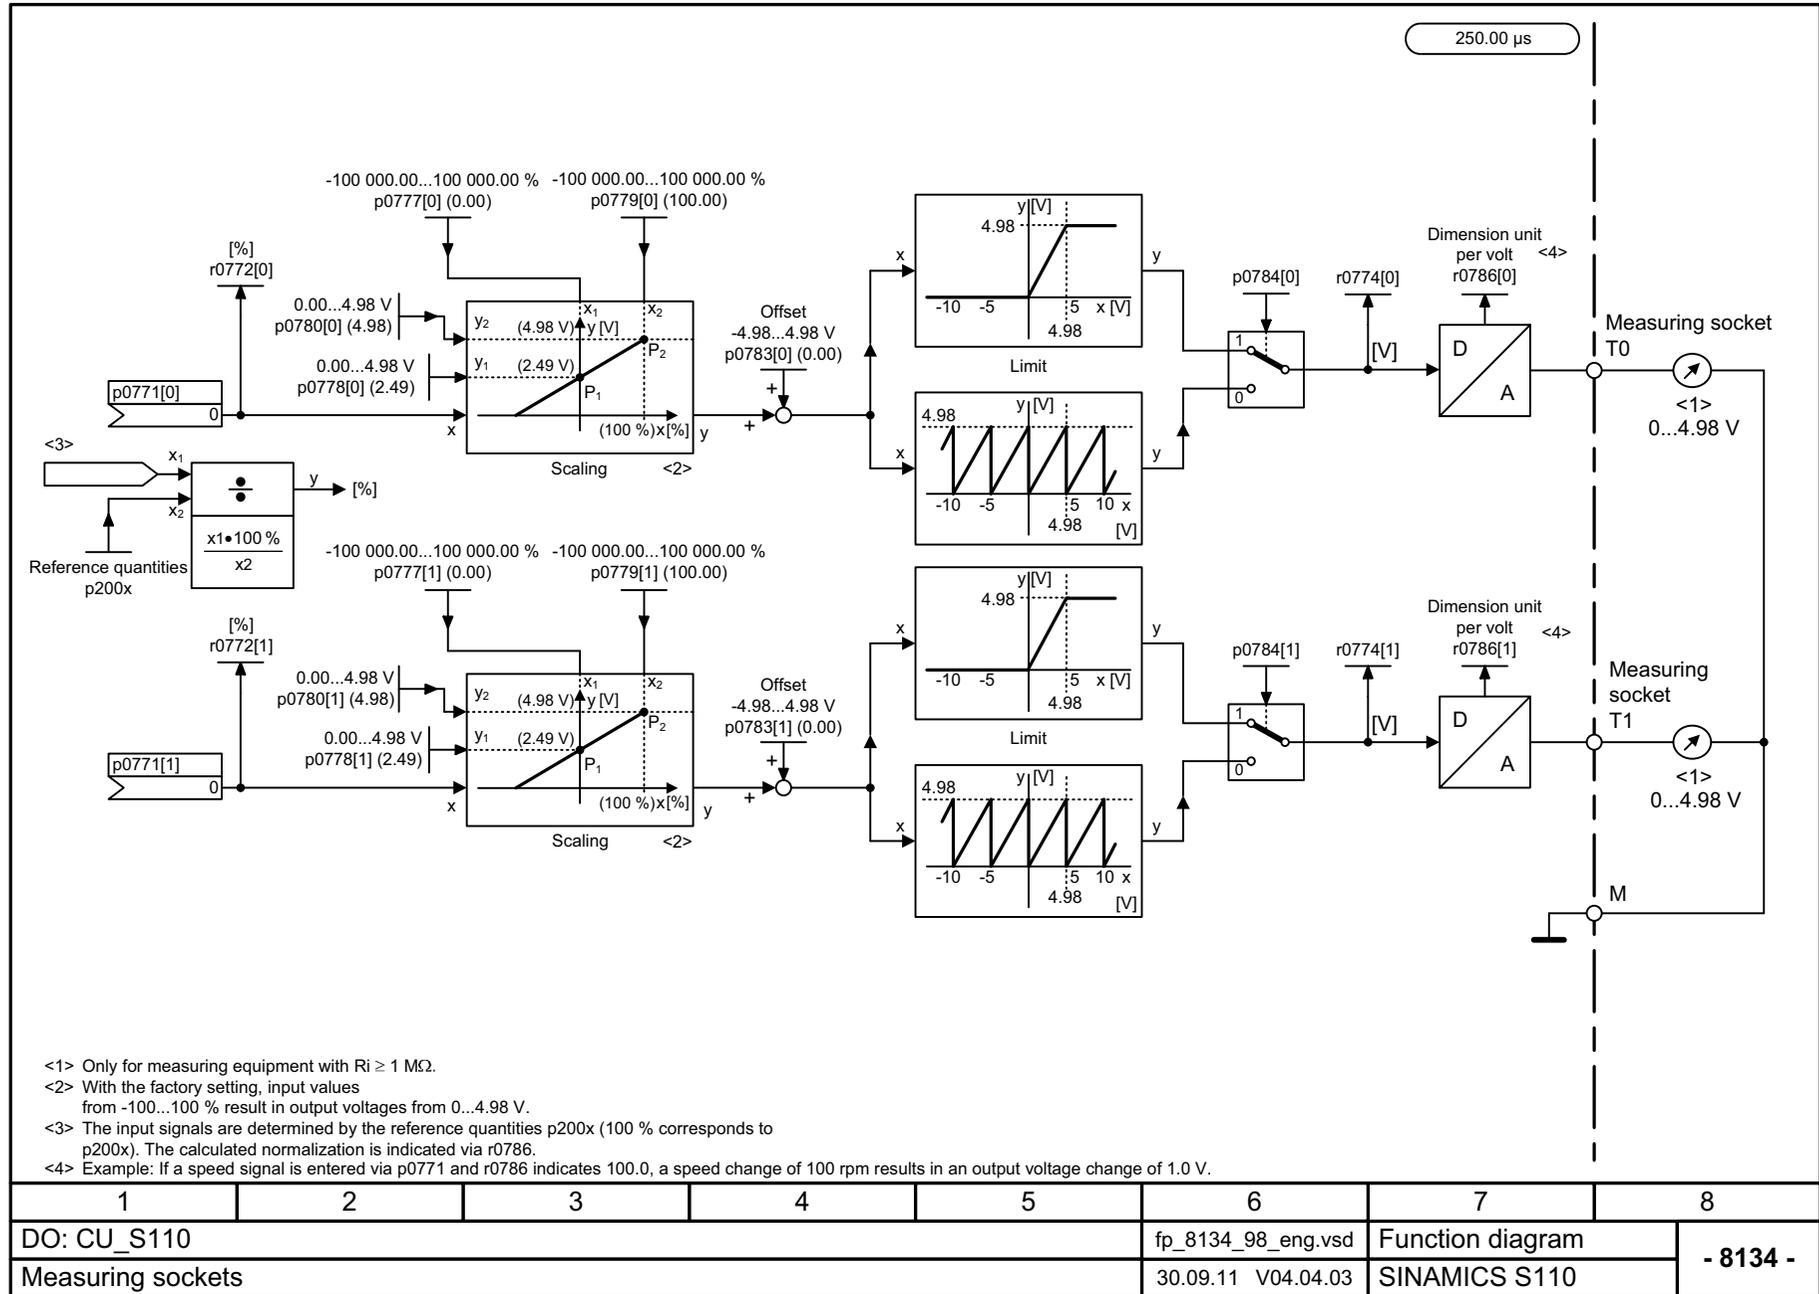

<1> The fault response, acknowledge mode and message type for all faults and alarms are set to meaningful default values in the factory setting. Changes that may be required are only possible in specific value ranges specified by SIEMENS. When the message type is changed, the supplementary information is transferred from fault value r0949 to alarm value r2124 and vice versa.

## 4.1 Overview of faults and alarms

### 4.1.1 General information on faults and alarms

#### Indicating faults and alarms

If a fault occurs, the drive indicates the fault and/or alarm.

The following methods are available for displaying faults and alarms:

- Display via the fault and alarm buffer for PROFIBUS.
- Display via the commissioning software in online operation.

#### Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> <li>• The appropriate fault reaction is initiated.</li> <li>• Status signal ZSW1.3 is set.</li> <li>• The fault is entered in the fault buffer.</li> </ul> <p>How are faults eliminated?</p> <ul style="list-style-type: none"> <li>• Remove the original cause of the fault.</li> <li>• Acknowledge the fault.</li> </ul>
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> <li>• Status signal ZSW1.7 is set.</li> <li>• The alarm is entered in the alarm buffer.</li> </ul> <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> <li>• Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.</li> </ul>

## Fault reactions

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	<p>No reaction when a fault occurs</p> <p><b>Note</b></p> <p>When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies:</p> <p>When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to the tracking mode until the fault has been rectified and acknowledged.</p>
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p><b>Closed-loop speed control (p1300 = 20, 21)</b></p> <ul style="list-style-type: none"> <li>n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121).</li> <li>When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires.</li> </ul> <p>Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint &lt;= speed threshold (p1226) has expired.</p> <p><b>Closed-loop torque control (p1300 = 23)</b></p> <ul style="list-style-type: none"> <li>The following applies to closed-loop torque control mode: Reaction as for OFF2.</li> <li>When the system switches to closed-loop control with p1501, the following applies: No separate braking reaction.</li> </ul> <p>If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</p>
OFF1_ DELAYED	-	As for OFF1, however delayed	<p>Faults with this fault reaction only become effective after the delay time in p3136 has expired.</p> <p>The remaining time up to OFF1 is displayed in r3137.</p>
OFF2	COAST STOP	Internal/external pulse disable	<p><b>Closed-loop speed and torque control</b></p> <ul style="list-style-type: none"> <li>Immediate pulse suppression, the drive "coasts" to a standstill.</li> <li>The motor holding brake (if one is being used) is closed immediately.</li> <li>Switching on inhibited is activated.</li> </ul>

STOP2	-	n_set = 0	<ul style="list-style-type: none"> <li>• n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135).</li> <li>• The drive remains in closed-loop speed control.</li> </ul>
IASC/ DCBRAKE	-	-	<ul style="list-style-type: none"> <li>• For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed.</li> <li>• For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1232, p1233, p1234).</li> </ul>
ENCODER	-	Internal/external pulse disable (p0491)	<p>The fault reaction ENCODER is applied as a function of the setting in p0491.</p> <p>Factory setting: p0491 = 0 --&gt; Encoder fault causes OFF2</p> <p><b>Notice</b></p> <p>When changing p0491, it is imperative that the information in the description of this parameter is carefully observed.</p>

## Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been eliminated.

Table 4-3 Acknowledging faults

Acknowledgement	Description
POWER ON	<p>The fault is acknowledged by a POWER ON process (switch drive unit off and on again).</p> <p><b>Note</b> If this action has not eliminated the fault cause, the fault is displayed again immediately after power-up.</p>
IMMEDIATE	<p>Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows:</p> <ol style="list-style-type: none"> <li>1 Set acknowledgement by parameter: p3981 = 0 --&gt; 1</li> <li>2 Acknowledging via binector inputs: <ul style="list-style-type: none"> <li>p2103            BI: 1. Acknowledge faults</li> <li>p2104            BI: 2. Acknowledge faults</li> <li>p2105            BI: 3. Acknowledge faults</li> </ul> </li> <li>3 Acknowledging using a PROFIBUS control signal: STW1.7 = 0 --&gt; 1 (edge)</li> <li>4 Acknowledge all faults <ul style="list-style-type: none"> <li>p2102            BI: Acknowledge all faults</li> </ul> <p>All of the faults on all of the drive objects of the drive system can be acknowledged using this binector input.</p> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>• These faults can also be acknowledged by a POWER ON operation.</li> <li>• If this action has not eliminated the fault cause, the fault will continue to be displayed after acknowledgement.</li> <li>• Safety Integrated faults The "Safe standstill" (SH) function must be deselected before these faults are acknowledged.</li> </ul> </li> </ol>
PULSE SUPPRESSION	<p>The fault can only be acknowledged when the pulses are inhibited (r0899.11 = 0).</p> <p>The same options are available for acknowledging as described under acknowledgement with IMMEDIATE.</p>

### 4.1.2 Explanation of the list of faults and alarms

The data in the following example has been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms" (Page 939) has the following layout:

----- **Start of example** -----

---

<b>Axxxxx (F, N)</b>	<b>Fault location (optional): Name</b>
<b>Message value:</b>	Component number: %1, fault cause: %2
<b>Drive object:</b>	List of objects.
<b>Reaction:</b>	NONE
<b>Acknowledgement:</b>	NONE
<b>Cause:</b>	Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional).
<b>Remedy:</b>	Description of possible remedies.
Reaction to F:	NONE (OFF1, OFF2, OFF3)
Acknowledgement for F:	IMMEDIATELY (POWER ON)
Reaction to N:	NONE
Acknowledgement for N:	NONE

----- **End of example** -----

<b>Axxxxx</b>	<b>Alarm xxxxx</b>
<b>Axxxxx (F, N)</b>	<b>Alarm xxxxx (message type can be changed to F or N)</b>
<b>Fxxxxx</b>	<b>Fault xxxxx</b>
<b>Fxxxxx (A, N)</b>	<b>Fault xxxxx (report type can be changed to A or N)</b>
<b>Nxxxxx</b>	<b>No message</b>
<b>Nxxxxx (A)</b>	<b>No message (message type can be changed to A)</b>
<b>Cxxxxx</b>	<b>Safety message (separate message buffer)</b>

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message" (or "No report")
- C means "Safety message"

The optional parentheses indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgement is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgement for F).

**Note**

You can change the default properties of a fault or alarm by setting parameters.

References: /FH3 SINAMICS S110 Function Manual  
Chapter "Diagnostics"

The "List of faults and alarms" (Page 939) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

---

**Fault location (optional): Name**

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

**Message value:**

The information provided under the message value informs you about the composition of the fault/alarm value.

**Example:**

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

**Drive object:**

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

**Reaction: Default fault reaction (adjustable fault reaction)**

Specifies the default reaction in the event of a fault.

The optional brackets indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

---

**Note**

See Table "Fault reactions" (Page 931)

---

**Acknowledgement: Default acknowledgement (adjustable acknowledgement)**

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional brackets indicate whether the default acknowledgement can be changed and which acknowledgement can be adjusted via parameters (p2126, p2127).

---

**Note**

See Table "Acknowledging faults" (Page 933)

---

**Cause:**

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0..63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0..7] and specifies additional, more precise information about an alarm.

**Remedy:**

Description of the methods available for eliminating the cause of the active fault/alarm

**WARNING**

In certain cases, servicing and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

### 4.1.3 Number ranges of faults and alarms

#### Note

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 939).

Faults and alarms are organized into the following number ranges:

Table 4-4 Number ranges of faults and alarms

### F01000 Internal software error

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- evaluate fault buffer (r0945).  
- carry out a POWER ON (power off/on) for all components.  
- upgrade firmware to later version.  
- contact the Hotline.  
- replace the Control Unit.

---

### F01001 FloatingPoint exception

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An exception occurred during an operation with the FloatingPoint data type.  
The error may be caused by the basic system or an OA application (e.g., FBLOCKS, DCC).  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.  
Note:  
Refer to r9999 for further information about this fault.  
r9999[0]: Fault number.  
r9999[1]: Program counter at the time when the exception occurred.  
r9999[2]: Cause of the FloatingPoint exception.  
Bit 0 = 1: Operation invalid  
Bit 1 = 1: Division by zero  
Bit 2 = 1: Overflow  
Bit 3 = 1: Underflow  
Bit 4 = 1: Inaccurate result  
**Remedy:**  
- carry out a POWER ON (power off/on) for all components.  
- check configuration and signals of the blocks in FBLOCKS.  
- check configuration and signals of DCC charts.  
- upgrade firmware to later version.  
- contact the Hotline.

### F01002 Internal software error

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- carry out a POWER ON (power off/on) for all components.  
- upgrade firmware to later version.  
- contact the Hotline.

---

**F01003 Acknowledgement delay when accessing the memory**

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A memory area was accessed that does not return a "READY".  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - carry out a POWER ON (power off/on) for all components.  
- contact the Hotline.

---

**N01004 (F, A) Internal software error**

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An internal software error has occurred.  
Fault value (r0949, hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - read out diagnostics parameter (r9999).  
- contact the Hotline.

**F01005 Firmware download for DRIVE-CLiQ component unsuccessful**

**Message value:** Component number: %1, fault cause: %2  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** It was not possible to download the firmware to a DRIVE-CLiQ component.  
Fault value (r0949, interpret hexadecimal):  
yyxxxx hex: yy = component number, xxxx = fault cause  
xxxx = 000B hex = 11 dec:  
DRIVE-CLiQ component has detected a checksum error.  
xxxx = 000F hex = 15 dec:  
The selected DRIVE-CLiQ component did not accept the contents of the firmware file.  
xxxx = 0012 hex = 18 dec:  
Firmware version is too old and is not accepted by the component.  
xxxx = 0013 hex = 19 dec:  
Firmware version is not suitable for the hardware release of the component.  
xxxx = 0065 hex = 101 dec:  
After several communication attempts, no response from the DRIVE-CLiQ component.  
xxxx = 008B hex = 139 dec:  
Initially, a new boot loader is loaded (must be repeated after POWER ON).  
xxxx = 008C hex = 140 dec:  
Firmware file for the DRIVE-CLiQ component not available on the memory card.  
xxxx = 008D hex = 141 dec:  
An inconsistent length of the firmware file was signaled. The firmware download may have been caused by a loss of connection to the firmware file. This can occur during a project download/reset in the case of a SINAMICS Integrated Control Unit, for example.  
xxxx = 008F hex = 143 dec:  
Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.

xxxx = 0090 hex = 144 dec:

When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card is defective.

xxxx = 0091 hex = 145 dec:

Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.

xxxx = 009C hex = 156 dec:

Component with the specified component number is not available (p7828).

xxxx = Additional values:

Only for internal Siemens troubleshooting.

**Remedy:**

- check the selected component number (p7828).
- check the DRIVE-CLiQ wiring.
- save suitable firmware file for download in the directory "/siemens/sinamics/code/sac/".
- use a component with a suitable hardware version
- after POWER ON has been carried out again for the DRIVE-CLiQ component, download firmware again. Depending on p7826, the firmware will be automatically downloaded.

**A01006      Firmware update for DRIVE-CLiQ component required**

**Message value:** Component number: %1

**Drive object:** All objects

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit.

Alarm value (r2124, interpret decimal):

Component number of the DRIVE-CLiQ component.

**Remedy:**

Firmware update using the commissioning software:

The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out.

Firmware update via parameter:

- take the component number from the alarm value and enter into p7828.
- start the firmware download with p7829 = 1.

**A01007      POWER ON for DRIVE-CLiQ component required**

**Message value:** Component number: %1

**Drive object:** All objects

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A DRIVE-CLiQ component must be powered up again (POWER ON) (e.g. due to a firmware update).

Alarm value (r2124, interpret decimal):

Component number of the DRIVE-CLiQ component.

Note:

For a component number = 1, a POWER ON of the Control Unit is required.

**Remedy:**

Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again.

**A01009 (N)      CU: Control module overtemperature**

**Message value:** -

**Drive object:** All objects

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.

**Remedy:** - check the air intake for the Control Unit.

- check the Control Unit fan.

Note:

The alarm automatically disappears after the limit value has been undershot.

**Remedy:**  
- replace Power Module.  
- carry out a POWER ON (power off/on) for all components.  
- upgrade firmware to later version.  
- contact the Hotline.

**F01011 (N) Download interrupted**

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The project download was interrupted.  
Fault value (r0949, interpret decimal):  
1: The user prematurely interrupted the project download.  
2: The communication cable was interrupted (e.g. cable breakage, cable withdrawn).  
3: The project download was prematurely ended by the commissioning software (e.g. STARTER, SCOUT).  
100: Different versions between the firmware version and project files "Download from card".  
**Note:**  
The response to an interrupted download is the state "first commissioning".  
**Remedy:**  
- check the communication cable.  
- download the project again.  
- boot from previously saved files (power-down/power-up or p0976).  
- when downloading from the card, use the matching version.

**F01012 (N) Project conversion error**

**Message value:** %1  
**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** OFF2 (NONE)  
**Acknowledge:** IMMEDIATELY  
**Cause:** When converting the project of an older firmware version, an error occurred.  
Fault value (r0949, interpret decimal):  
Parameter number of the parameter causing the error.  
For fault value = 600, the following applies:  
The temperature evaluation is no longer assigned to the power unit but to the encoder evaluation.  
**Notice:**  
Monitoring of the motor temperature is no longer ensured.  
**Remedy:** Check the parameter indicated in the fault value and correctly adjust it accordingly.  
For fault value = 600:  
Parameter p0600 must be set to the values 1 or 2 in accordance with the assignment of the internal encoder evaluation to the encoder interface.  
Value 1 means: The internal encoder evaluation is assigned to the encoder interface 1 via p0187.  
Value 2 means: The internal encoder evaluation is assigned to the encoder interface 2 via p0188.  
- If necessary, the internal encoder evaluation must be assigned to an encoder interface via parameters p0187 or p0188 accordingly.  
- If necessary, upgrade the firmware to a later version.

Alarm value (r2124, interpret decimal):  
0: Checksum of one file is incorrect.  
1: File missing.  
2: Too many files.  
3: Incorrect firmware version.  
4: Incorrect checksum of the back-up file.  
See also: r9925 (Firmware file incorrect)  
**Remedy:** For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition.

#### **F01018 Booting has been interrupted several times**

**Message value:** -

**Drive object:** All objects

**Reaction:** NONE

**Acknowledge:** POWER ON

**Cause:** Module booting was interrupted several times.

Possible reasons for booting being interrupted:

- POWER OFF of the module.

- CPU crash.

- USER data invalid.

After this fault is output, then the module is booted with the factory settings.

**Remedy:** Power down the module and power it up again.

**Note:**

After switching on, the module reboots from the USER data (if available).

If the fault situation is repeated, then this fault is again output after several interrupted boots.

#### **F01030 Sign-of-life failure for master control**

**Message value:** -

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** OFF3 (ENCODER, IASC/DCBRAKE, NONE, OFF1, OFF2, STOP1, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** For active PC master control, no sign-of-life was received within the monitoring time.

The master control was returned to the active BICO interconnection.

**Remedy:** Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.  
 For the commissioning software, the monitoring time is set as follows:  
 <Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.  
 Notice:  
 The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

**Remedy:** Remove the illegal components and restart the system.

---

**F01355**      **Topology: Actual topology changed**

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The device target topology (p0099) does not correspond to the device actual topology (r0098).  
The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning software.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:** One of the following counter-measures can be selected if no faults have occurred in the topology detection itself:  
If commissioning is still not completed:  
- carry out a self-commissioning routine (starting from p0009 = 1).  
In general:  
Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107).  
Generating servo drives: Set p0097 to 1, set p0009 to 0.  
Generating vector drives: Set p0097 to 2, set p0009 to 0.  
Generating vector drives with parallel circuit: Set p0097 to 12, set p0009 to 0.  
In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107).  
If commissioning has already been completed:  
- re-establish the original connections and re-connect power to the Control Unit.  
- restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again.  
- change the device parameterization to match the connections (this is only possible using the commissioning software).  
Notice:  
Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning software and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

#### **A01508 BICO: Interconnections to inactive objects exceeded**

**Message value:** -  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The maximum number of BICO interconnections (signal sinks) when de-activating a drive object was exceeded.  
When de-activating a drive object, all BICO interconnections (signal sinks) are listed in the following parameters:  
- r9498[0...29]: List of the BI/CI parameters involved.  
- r9499[0...29]: List of the associated BO/CO parameters.  
**Remedy:** The alarm automatically disappears as soon as no BICO interconnection (value = 0) is entered in r9498[29] and r9499[29].  
**Notice:**  
When re-activating the drive object, all BICO interconnections should be checked and if required, re-established.

<b>Cause:</b>	During booting, the system detected that the "Firmware update automatic" function (p7826 = 1) was not activated. This function must be activated for automatic firmware updates/downgrades to prevent impermissible version combinations when safety functions are enabled. Note: This fault does not result in a safety stop response.
<b>Remedy:</b>	When safety functions are enabled (p9501 <> 0 and/or p9601 <> 0): 1. Activate the "Firmware update automatic" function (p7826 = 1). 2. Save the parameters (p0977 = 1) and carry out a POWER ON. When de-activating the safety functions (p9501 = 0, p9601 = 0), the fault can be acknowledged after exiting the safety commissioning mode.

<b>Cause:</b>	At least one enabled "Safety Cam" (SCA) is parameterized in p9536 or p9537 too close to the tolerance range around the modulo position. **Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** The axis configuration was changed (e.g. changeover between linear axis and rotary axis).  
Parameter p0108.13 is internally set to the correct value.  
**Note:**  
This fault does not result in a safety stop response.  
Fault value (r0949, interpret decimal):  
Parameter number of parameter that initiated the change.  
See also: p9502 (SI Motion axis type (processor 1))  
**Remedy:** The following should be carried out after the changeover:  
- exit the safety commissioning mode (p0010).  
- save all parameters (p0977 = 1 or "copy RAM to ROM").  
- carry out a POWER ON.

Once the Control Unit has been switched on, safety message F01680 or F30680 indicates that the checksums in r9398[0] and r9728[0] have changed in the drive. The following must, therefore, be carried out:

- activate safety commissioning mode again.
- complete safety commissioning of the drive.
- exit the safety commissioning mode (p0010).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON.

Note:

For the commissioning software, the units are only consistently displayed after a project upload.

<b>Reaction:</b>	NONE (OFF1, OFF2, OFF3)
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	There is not sufficient memory space in the NVRAM on the drive to save parameters r9781 and r9782 (safety logbook). Note: This fault does not result in a safety stop response. Fault value (r0949, interpret decimal): 0: There is no physical NVRAM available in the drive. 1: There is no longer any free memory space in the NVRAM.
<b>Remedy:</b>	For fault value = 0: - use a Control Unit NVRAM. For fault value = 1: - de-select functions that are not required and that take up memory space in the NVRAM. - contact the Hotline. Note: NVRAM: Non-Volatile Random Access Memory (non-volatile read and write memory)

<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The configured times for PROFIBUS communication are not permitted and the DP cycle is used as the actual value acquisition cycle for the safe movement monitoring functions: Isochronous PROFIBUS: the total of Ti and To is too high for the set DP cycle. The DP cycle should be at least 1 current controller cycle greater than the sum of Ti and To. Non-isochronous PROFIBUS: the DP cycle must be at least 4 x current controller cycle.
<b>Remedy:</b>	Configure Ti and To low so that they are suitable for the DP cycle or increase the DP cycle time. Alternative when SI monitoring integrated in the drive is enabled (p9601/p9801 > 0): Use the actual value acquisition cycle p9511/p9311 and, in turn, set independently from DP cycle. The actual value sensing clock cycle must be at least four times the current controller clock cycle. A clock cycle ratio of at least 8:1 is recommended. **Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP A (pulses are suppressed via the safety shutdown path of the Control Unit).

Possible causes:

- stop request from the 2nd monitoring channel.
- pulses not suppressed after a parameterized time (p9557) after test stop selection.
- subsequent response to the message C01706 "SI Motion CU: SAM/SBR limit exceeded".
- subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
- subsequent response to the message C01701 "SI Motion CU: STOP B initiated".

**Remedy:**

- remove the cause of the fault on the 2nd monitoring channel.
- carry out a diagnostics routine for message C01706.
- carry out a diagnostics routine for message C01714.
- carry out a diagnostics routine for message C01701.
- check the value in p9557 (where available), increase the value if necessary, and carry out a POWER ON
- check the shutdown path of the Control Unit (check DRIVE-CLiQ communication if it has been implemented)
- replace the Motor Module/Power Module
- replace Control Unit.

<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible. If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output. The message value that resulted in a STOP F is displayed in r9725. The described message values involve the crosswise data comparison between the Control Unit and Motor Module. If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK. The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply: - cycle times not set uniformly (p9500/p9300 and p9511/p9311) - differently parameterized axis types (p9502/p9302). - excessively fast cycle times (p9500/p9300, p9511/p9311). - for message values 3, 44 ... 57, 232 and 1-encoder systems, differently parameterized encoder values (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326). - incorrect synchronization. Message value (r9749, interpret decimal): 0 to 999: Number of the cross-compared data that resulted in this fault. Message values that are not subsequently listed are only for internal Siemens troubleshooting. 0: Stop request from the other monitoring channel. 1: Status image of monitoring functions SOS, SLS or SLP (result list 1) (r9710[0], r9710[1]). 2: Status image of monitoring function SCA or n < nx (result list 2) (r9711[0], r9711[1]). 3: The position actual value differential (r9713) between the two monitoring channels is greater than the tolerance in p9542/p9342. When actual value synchronization is enabled (p9501.3/p9301.3), the velocity differential (based on the position actual value) is greater than the tolerance in p9549/p9349. 4: Error when synchronizing the crosswise data comparison between the two channels. 5: Function enable signals (p9501/p9301) 6: Limit value for SLS1 (p9531[0]/p9331[0]) 7: Limit value for SLS2 (p9531[1]/p9331[1]) 8: Limit value for SLS3 (p9531[2]/p9331[2]) 9: Limit value for SLS4 (p9531[3]/p9331[3])

  - 44 ... 57: General
- Possible cause 1 (during commissioning or parameter modification)  
The tolerance value for the monitoring function is not the same on the two monitoring channels.
- Possible cause 2 (during active operation)  
The limit values are based on the actual value (r9713). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to fault value 3). This can be ascertained by checking the safe actual positions.

#### Remedy:

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

Re message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).

Re message value = 3:

Commissioning phase:

Encoder evaluation for own or second channel has been set incorrectly --> Correct the encoder evaluation.

In operation:

Check the mechanical design and the encoder signals.

Re message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with fault value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.

Re message value = 232:

-increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

Re message value = 1 ... 999:

- if the message value is listed under cause: Check the crosswise-compared parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (power off/on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Re message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

Re message value = 1001:

- carry out a POWER ON (power off/on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

Re message value = 1005:

- check the conditions for pulse enable.

Re message value = 1011:

- for diagnostics, refer to parameter (r9571).

Re message value = 1012:

- upgrade the Sensor Module software.

- for 1-encoder systems, check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).

- For DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

Re message value = 1020, 1021:

- check the communication link.
- increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (power off/on) for all components.
- replace the hardware.

Re message value = 1033:

- If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

Re message value = 1041:

- reduce the minimum current (p9588).
- for synchronous motors increase the absolute value of p9783.
- Check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

Re message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.
- increase the minimum current (p9588).

Re message value = 1043:

- increase the voltage tolerance (p9589).
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

- carry out a POWER ON (power off/on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

Re message value = 5012:

<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The fail-safe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002 / p10102. Fault value (r0949, interpret bitwise binary): yyyyxxxx bin xxxx: Discrepancy error for fail-safe digital inputs (F-DI). Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... yyyy: Discrepancy error for fail-safe digital outputs (F-DO). Bit 0: Discrepancy error for F-DO 0 ... Note: If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs.
<b>Remedy:</b>	- check the wiring of the F-DI (contact problems). Note: This message can be acknowledged via F-DI or PROFIsafe. Discrepancy errors of an F-DI can only be completely acknowledged if safe acknowledgement was carried out once the cause of the error was resolved (p10006 or acknowledgment via PROFIsafe). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state internally. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.

## 4 Faults and alarms

### 4.2 List of faults and alarms

If the period of a cyclic switching pulse has the order of magnitude of double the value of p10002, then the following formulas must be checked.

$p10002 < (tp / 2) - td$  (discrepancy time must be less than half the period minus the actual discrepancy time)

$p10002 \geq p9500$  (discrepancy time must be no less than P9500)

$p10002 > td$  (discrepancy time must be greater than the switch discrepancy time which may actually apply)

td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI sampling cycle (see p9500).

tp = period for a switching operation in ms.

When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.

If the period of a cyclic switching pulse has the order of magnitude of twice the debounce time, then the following formulas should be checked.

$p10002 < p10017 + 1 \text{ ms} - td$

$p10002 > td$

$p10002 \geq p9500$

Example:

For a 12 ms SI sampling cycle and a switching frequency of 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows:

$p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$

Rounded-off, p10002 ≤ 36 ms is obtained (since the discrepancy time can only be accepted as a whole SI sampling cycle, the value will need to be rounded up or down to a whole SI sampling time value if the result is not an exact multiple of an SI sampling cycle).

<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	A fault has occurred on the CU side during the test stop for the fail-safe outputs. Fault value (r0949, interpret hexadecimal): RRRVWXYZ hex: R: Reserved. V: Actual state of the DO channel concerned (see X) on the CU (corresponds to the states read back from the hardware, bit 0 = DO 0, bit 1 = DO 1, etc.). W: Required state of the DO channel concerned (see X, bit 0 = DO 0, bit 1 = DO 1, etc.). X: DO channels involved, which indicate an error (bit 0 = DO 0, bit 1 = DO 1, etc.). Y: Reason for the test stop fault. Z: State of the test stop in which the fault has occurred.

Y: Reason for the test stop fault

Y = 1: MM side in incorrect test stop state (internal fault).

Y = 2: Expected states of the DOs were not fulfilled (CU305: readback via DI 22 / CU240 readback DI 2).

Y = 3: Incorrect timer state on CU side (internal fault)

Y = 4: Expected states of the diag DOs were not fulfilled (CU305: internal readback on MM channel).

Y = 5: Expected states of the second diag DOs were not fulfilled (CU305: internal readback on CU channel).

X and V indicate the DI or Diag-DO state dependent upon the reason for the fault (2, 4 or 5).

In the event of multiple test stop faults, the first one that occurred is shown.

Z: Test stop state and associated test actions

Z = 0 ... 3: Synchronization phase of test stop between CU and Motor Module no switching operations

Z = 4: DO + OFF and DO - OFF

Z = 5: Check to see if states are as expected

Z = 6: DO + ON and DO - ON

Z = 7: Check to see if states are as expected

Z = 8: DO + OFF and DO - ON

Z = 9: Check to see if states are as expected

Z = 10: DO + ON and DO - OFF

Z = 11: Check to see if states are as expected

Z = 12: DO + OFF and DO - OFF

Z = 13: Check to see if states are as expected

Z = 14: End of test stop

Diag expected states in table format:

5: 0/-/-1

7: 0/-/-0

9: 0/-/-0

11: 1/-/-1

13: 0/-/-1

Second diag expected states in table format:

Test stop state: Expectation Mode 1 / Mode 2 / Mode 3 / Mode 4

5: -/-/-1

7: -/-/-0

9: -/-/-1

11: -/-/-0

13: -/-/-1

DI expected states in table format:

Test stop state: Expectation Mode 1 / Mode 2 / Mode 3 / Mode 4

5: -/1/1/-

7: -/0/0/-

9: -/0/1/-

11: -/0/1/-

13: -/1/1/-

Example:

Fault F01773 (CU) is signaled with fault value = 0001\_0127 and fault F30773 (MM) is signaled with fault value 0000\_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001\_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000\_0127 on the MM indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on the other channel (CU).

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** Check the wiring of the F-DOs and restart the test stop.  
**Note:**  
The fault is withdrawn if the test stop is successfully completed.  
In the event of multiple test stop faults, the first one that occurred is shown.  
Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

**Message value:** -  
**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:**  
- after powering up the drive, a test stop has still not been carried out.  
- a new test stop is required after commissioning.  
- the time to carry out the forced checking procedure (test stop) has expired (p10003).  
**Remedy:** Initiate test stop (BI: p10007).

**Message value:** -  
**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The drive waits for communication to be established with SINUMERIK or TM54F to execute the safety-relevant motion monitoring functions.  
**Note:**  
In this state, the pulses are safely suppressed.  
**Remedy:** If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made as appropriate:  
For communication with SINUMERIK, the following applies:  
- check any other PROFIBUS messages/signals present and remove their cause.  
- check that assignment of the axes on the higher-level control to the drives in the drive unit is correct.  
- check enable signal of the safety-relevant motion monitoring functions for the corresponding axis on the higher-level control and if required, set it.  
For communication with TM54F, the following applies:  
- check any other messages/signals present for DRIVE-CLiQ communication with the TM54F and remove their cause.  
- check the setting of p10010. All the drive objects controlled by the TM54F must be listed.

<b>Drive object:</b>	All objects
<b>Reaction:</b>	NONE (ENCODER, IASC/DCBRAKE, OFF1, OFF2, OFF3, STOP1, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	A DRIVE-CLiQ connection fault has occurred. Fault value (r0949, interpret decimal): 100 ... 107: Communication via DRIVE-CLiQ socket X100 ... X107 has not been switched to cyclic operation. The cause may be an incorrect structure or a configuration that results in an impossible bus timing. 10: Loss of the DRIVE-CLiQ connection. The cause may be, for example, that the DRIVE-CLiQ cable was withdrawn from the Control Unit or as a result of a short-circuit for motors with DRIVE-CLiQ. This fault can only be acknowledged in cyclic communication. 11: Repeated faults when detecting the connection. This fault can only be acknowledged in cyclic communication. 12: A connection was detected but the node ID exchange mechanism does not function. The reason is probably that the component is defective. This fault can only be acknowledged in cyclic communication.
<b>Remedy:</b>	Re fault value = 100 ... 107: - ensure that the DRIVE-CLiQ components have the same firmware versions. - avoid longer topologies for short current controller clock cycles. For fault value = 10: - check the DRIVE-CLiQ cables at the Control Unit. - remove any short-circuit for motors with DRIVE-CLiQ. - carry out a POWER ON. For fault value = 11: - check the electrical cabinet design and cable routing for EMC compliance For fault value = 12: - replace the component involved.

#### PB/PN: Configuration telegram error

**Message value:** %1

**Drive object:** All objects

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:**

A controller attempts to establish a connection using an incorrect configuring telegram.

Alarm value (r2124, interpret decimal):

1: Connection established to more drive objects than configured in the device. The drive objects for process data exchange and their sequence are defined in p0978.

2: Too many PZD data words for output or input to a drive object. The number of possible PZD items in a drive object is specified by the number of indices in r2050/p2051.

3: Uneven number of bytes for input or output.

4: Setting data for synchronization not accepted. For more information, see A01902.

223: Illegal clock synchronization for the PZD interface set in p8815[0].

253: PN Shared Device: illegal mixed configuration of PROFIsafe and PZD.

254: PN Shared Device: Illegal double assignment of a slot/subslot.

255: PN: Configured drive object and existing drive object do not match.

501: PROFIsafe parameter error (e.g. F\_dest).

**Remedy:**

Check the bus configuration on the master and slave sides.

Re alarm value = 1:

Check the list of the drive objects with process data exchange (p0978).

With p0978[x] = 0, all of the following drive objects in the list are excluded from the process data exchange.

Re alarm value = 2:

Check the number of data words for output and input to a drive object.

Re alarm value = 255:

Check the drive objects to be configured.

Re alarm value = 501:

Check the set PROFIsafe address (p9610).

**Cause:**

Parameterization for isochronous operation is not permissible.

Alarm value (r2124, interpret decimal):

0: Bus cycle time Tdp < 0.5 ms.

1: Bus cycle time Tdp > 32 ms.

2: Bus cycle time Tdp is not an integer multiple of the current controller sampling time.

3: Instant of the actual value sensing Ti > Bus cycle time Tdp or Ti = 0.

4: Instant of the actual value sensing Ti is not an integer multiple of the current controller sampling time.

5: Instant of the setpoint acceptance To >= Bus cycle time Tdp or To = 0.

6: Instant of the setpoint acceptance To is not an integer multiple of the current controller sampling time.

7: Master application cycle time Tmapc is not an integer multiple of the speed controller sampling time.

8: Bus reserve bus cycle time Tdp - data exchange time Tdx less than two current controller sampling times.

10: Instant of the setpoint acceptance To <= data exchange time Tdx + current controller sampling time

11: Master application cycle time Tmapc > 14 x Tdp or Tmapc = 0.

12: PLL tolerance window  $T_{pll\_w} > T_{pll\_w\_max}$ .  
 16: Instant of the actual value sensing  $T_i$  is less than two current controller sampling times.

**Remedy:**

- Adapt the bus parameterization  $T_{dp}$ ,  $T_i$ ,  $T_o$ .

Re alarm value = 10:

- Reduce  $T_{dx}$  by using fewer bus participants or shorter telegrams.

<b>A02009</b>	<b>Function generator: Illegal mode</b>
<b>Message value:</b>	%1
<b>Drive object:</b>	All objects
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The set operating mode (p1300) of the drive object is not permissible when using the function generator. Alarm value (r2124, interpret decimal): Number of the drive object involved.
<b>Remedy:</b>	Change the operating mode for this drive object to p1300 = 20 (encoderless speed control) or p1300 = 21 (speed control with encoder). Note: The alarm is reset as follows: - remove the cause of this alarm. - restart the function generator.

**A02011      Function generator: The actual drive speed is not zero**

**Message value:** -  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The speed actual value of a drive selected for connection is greater than the value for the standstill detection set using p1226.  
**Remedy:** Set the relevant drives to zero speed before starting the function generator.  
**Note:**  
The alarm is reset as follows:  
- remove the cause of this alarm.  
- restart the function generator.

#### **A02041**      **Function generator: Illegal value for bandwidth**

**Message value:** -  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The bandwidth referred to the time slice clock cycle of the function generator has either been set too low or too high. Depending on the time slice clock cycle, the bandwidth is defined as follows:  
Bandwidth\_max =  $1 / (2 \times \text{time slice clock cycle})$   
Bandwidth\_min = Bandwidth\_max / 100000  
Example:  
Assumption: p4830 = 125  $\mu$ s  
--> Bandwidth\_max =  $1 / (2 \times 125 \mu\text{s}) = 4000 \text{ Hz}$   
--> Bandwidth\_min =  $4000 \text{ Hz} / 100000 = 0.04 \text{ Hz}$   
**Note:**  
p4823: Function generator bandwidth  
p4830: Function generator time slice clock cycle  
See also: p4823 (Function generator bandwidth), p4830 (Function generator time slice cycle)  
**Remedy:** Check the value for the bandwidth and adapt accordingly.  
**Note:**  
The alarm is reset as follows:  
- remove the cause of this alarm.  
- restart the function generator.

**Cause:** The trace has already been started.  
See also: p4700 (Trace control)  
**Remedy:** Stop the trace and, if necessary, start again.

---

**A02055 Trace: Recording time too short**

**Message value:** -  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The trace duration is too short.  
The minimum is twice the value of the trace clock cycle.  
See also: p4721 (Trace recording time)  
**Remedy:** Check the selected recording time and, if necessary, adjust.

---

**A02056 Trace: Recording cycle too short**

**Message value:** -  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The selected recording cycle is shorter than the selected basic clock cycle 0 (p0110[0]).  
See also: p4720 (Trace recording cycle)  
**Remedy:** Increase the value for the trace cycle.

**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The time slice clock cycle selected does not match any of the existing time slices.  
See also: p4723 (Trace time slice cycle)  
**Remedy:** Enter an existing time slice clock cycle. The existing time slices can be read out via p7901.  
See also: r7901 (Sampling times)

---

**A02058 Trace: Time slice clock cycle for endless trace not valid**

**Message value:** -  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The selected time slice clock cycle cannot be used for the endless trace  
See also: p4723 (Trace time slice cycle)  
**Remedy:** Enter the clock cycle of an existing time slice with a cycle time  $\geq 2$  ms for up to 4 recording channels or  $\geq 4$  ms from 5 recording channels per trace.  
The existing time slices can be read out via p7901.  
See also: r7901 (Sampling times)

---

**A02059 Trace: Time slice clock cycle for 2 x 8 recording channels not valid**

**Message value:** -  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The selected time slice clock cycle cannot be used for more than 4 recording channels.  
See also: p4723 (Trace time slice cycle)  
**Remedy:** Enter the clock cycle of an existing time slice with a cycle time  $\geq 4$  ms or reduce the number of recording channels to 4 per trace.  
The existing time slices can be read out via p7901.

Fault value (r0949, interpret hexadecimal):  
yyxx hex: yy = fault cause, xx = application ID  
yy = 1:  
The action p7770 = 1 is not supported by this version if Drive Control Chart (DCC) is activated for the drive object concerned.  
yy = 2:  
The data length of the specified application is not the same in the NVRAM and the backup.  
yy = 3:  
The data checksum in p7774 is not correct.

yy = 4:  
No data available to load.  
**Remedy:** Perform the remedy according to the results of the troubleshooting.  
If necessary, start the action again.

**F03001 NVRAM checksum incorrect**

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A checksum error occurred when evaluating the non-volatile data (NVRAM) on the Control Unit.  
The NVRAM data affected was deleted.

**A03507 (F, N) Digital output not set**

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** Despite specification by the signal source the digital output has not been set.  
Possible causes:  
- power supply missing.  
- the digital output is in current limiting (e.g. due to short-circuit).  
- The digital output is being used for Safety Extended Functions.  
- The control has authority to access the digital output by means of direct access (see also r0729).  
Alarm value (r2124, interpret bitwise binary):  
Digital output involved (structured the same as r0747).  
**Remedy:**  
- check the 24 V power supply (e.g. X131.7 for CU305 (ground is X131.8)).  
- check the output terminals for short-circuits.  
- reset the signal source of the digital output for use by Safety Extended functions.  
- carry out a POWER ON (power off/on).

The motor temperature has exceeded the fault threshold (p0605) or the timer (p0606) after the alarm threshold was exceeded (p0604) has expired.  
PTC, bimetallic NC contact:  
The response threshold of 1650 ohms was exceeded (in SME p4600..p4603 or in TM120 p4610..p4613 = 10 or 30), or the timer (p0606) has expired after 1650 ohms was exceeded (in SME p4600..p4603 or in TM120 p4610..p4613 = 12 or 32).  
Possible causes:  
- Motor is overloaded  
- motor ambient temperature too high.  
- PTC / bimetallic NC contact: Wire breakage or sensor not connected.

Fault value (r0949, interpret decimal):

200: The I2t motor model signals an overtemperature (p0612.0 = 1, p0611 > 0).

Fault value (r0949, interpret hexadecimal):

ccccbbaa hex:

cccc = preliminary parameter number, bb = supplementary information, aa = fault cause

Fault causes for the trigger parameter itself:

19: Called file is not valid for the trigger parameter.

20: Called file is not valid for parameter 15.

21: Called file is not valid for parameter 700.

22: Called file is not valid for parameter 1000.

23: Called file is not valid for parameter 1500.

24: Data type of a TAG is incorrect (e.g. Index, number or bit is not U16).

Fault causes for the parameters to be set:

25: Error level has an undefined value.

26: Mode has an undefined value.

27: A value was entered as string in the tag value that is not "DEFAULT".

31: Entered drive object type unknown.

32: A device was not able to be found for the determined drive object number.

34: A trigger parameter was recursively called.

35: It is not permissible to write to the parameter via macro.

36: Check, writing to a parameter unsuccessful, parameter can only be read, not available, incorrect data type, value range or assignment incorrect.

37: Source parameter for a BICO interconnection was not able to be determined.

38: An index was set for a non-indexed (or CDS-dependent) parameter.

39: No index was set for an indexed parameter.

41: A bit operation is only permissible for parameters with the parameter format DISPLAY\_BIN.

42: A value not equal to 0 or 1 was set for a BitOperation.  
43: Reading the parameter to be changed by the BitOperation was unsuccessful.  
51: Factory setting for DEVICE may only be executed on the DEVICE.  
61: The setting of a value was unsuccessful.

**Remedy:**  
- check the parameter involved.  
- check the macro file and BICO interconnection.

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** Open-loop/closed-loop control parameters have had to be changed for the following reasons:  
1. As a result of other parameters, they have exceeded the dynamic limits.  
2. They cannot be used due to the fact that the hardware detected not having certain features.  
Fault value (r0949, interpret decimal):  
Changed parameter number.  
See also: p0640 (Current limit), p1082 (Maximum speed), p1300 (Open-loop/closed-loop control operating mode), p1800 (Pulse frequency setpoint)

**Remedy:** Not necessary.

**Message value:** Parameter: %1  
**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit representation (cause: e.g. the steady-state minimum/maximum limit or that defined in the application was violated). The values of the parameters were set to the corresponding violated minimum/maximum limit or to the factory setting.

#### **Drive: Encoderless operation not possible for the selected pulse frequency**

**Message value:** Parameter: %1

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** Encoderless operation is not possible for the selected pulse frequency (p1800).

Encoderless operation is activated under the following conditions:

- the changeover speed for encoderless operation (p1404) is less than the maximum speed (p0322).
- a control type with encoderless operation has been selected (p1300).
- encoder faults of the motor encoder result in a fault response with encoderless operation (p0491).

See also: p0491 (Motor encoder fault response ENCODER), p1300 (Open-loop/closed-loop control operating mode), p1404 (Encoderless operation changeover speed), p1800 (Pulse frequency setpoint)

**Remedy:** Increase the pulse frequency (p1800).

Note:

In encoderless operation, the pulse frequency must be at least as high as half the current controller clock cycle (1/p0115[0]).

#### **Units changeover: Parameter limit violation due to units changeover**

**Message value:** Parameter: %1

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A changeover of units was initiated.

Possible causes for the violation of a parameter limit are:

- when rounding off a parameter corresponding to its decimal places, the steady-state minimum or maximum limit was violated.
- inaccuracies for the data type "FloatingPoint".

In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down.

Fault value (r0949, interpret decimal):

Diagnostics parameter r9451 to display all parameters whose value had to be adapted.

See also: p0100 (IEC/NEMA mot stds), p0349 (System of units motor equivalent circuit diagram data), p0505 (Selecting the system of units), p0595 (Selecting technological units)

**F07412 Drive: Commutation angle incorrect (motor model)**

**Message value:** -

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** ENCODER (NONE, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** An incorrect commutation angle was detected that can result in a positive coupling in the speed controller.

Possible causes:

- the motor encoder is incorrectly adjusted with respect to the magnet position.
- the motor encoder is damaged.
- the angular commutation offset is incorrectly set (p0431).
- data to calculate the motor model has been incorrectly set (p0356 (motor-stator leakage inductance) and/or p0350 (motor-stator resistance) and/or p0352 (cable resistance)).

---

- the changeover speed for the motor model is too low (p1752). The monitoring function only becomes effective above the changeover speed.

- pole position identification might have calculated an incorrect value when activated (p1982 = 1).

- the motor encoder speed signal is faulted.

- the control loop is instable due to incorrect parameterization.

Fault value (r0949, interpret decimal):

0: The comparison of the pole position angle from the encoder and motor model resulted in an excessively high value (> 80 ° electrical).

**Remedy:**

- if the encoder mounting was changed - re-adjust the encoder.

- replace the defective motor encoder.

- correctly set the angular commutation offset (p0431). If required, determine using p1990.

- correctly set the motor stator resistance, cable resistance and motor-stator leakage inductance (p0350, p0352, p0356).

Calculate the cable resistance from the cross-section and length, check the inductance and stator resistance using the motor data sheet, measure the stator resistance, e.g. using a multimeter - and if required, again identify the values using the stationary motor data identification (p1910).

- increase the changeover speed for the motor model (p1752). The monitoring is completely de-activated for p1752 > p1082 (maximum speed).

- with pole position identification activated (p1982 = 1) check the procedure for pole position identification (p1980) and force a new pole position identification procedure by means of de-selection followed by selection (p1982 = 0 -> 1).

Note:

For High Dynamic Motors (1FK7xxx-7xxx), for applications with a higher current, if necessary, the monitoring should be disabled.

**Cause:**

An incorrect commutation angle was detected that can result in a positive coupling in the speed controller.

Within the pole position identification routine (p1982 = 2):

- a difference of > 45 ° electrical to the encoder angle was determined.

**Remedy:**

- correctly set the angular commutation offset (p0431).

- re-adjust the motor encoder after the encoder has been replaced.

- replace the defective motor encoder.

- check the pole position identification routine. If the pole position identification routine is not suitable for this motor type, then disable the plausibility check (p1982 = 0).

**Drive object:**

SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:**

ENCODER (NONE, OFF2)

**Acknowledge:**

IMMEDIATELY

**Cause:**

The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).

Cause 1:

The encoder was replaced.

Cause 2:

A third-party, built-in or linear motor was re-commissioned.

Cause 3:

The motor with integrated and adjusted encoder was replaced.

Cause 4:

The firmware was updated to a version that checks the encoder serial number.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** Re causes 1, 2:  
Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.  
SERVO:  
If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.  
or  
Set the adjustment via p0431. In this case, the new serial number is automatically accepted.  
or  
Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.  
Re causes 3, 4:  
Accept the new serial number with p0440 = 1.

<b>Reaction:</b>	OFF2 (OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	In the case of a fault at maximum speed, the motor can generate an overvoltage that can destroy the drive system. Fault value (r0949, interpret hexadecimal): Associated Drive Data Set (DDS).
<b>Remedy:</b>	Overvoltage protection can be implemented in the following ways: - limit the maximum speed (p1082) without any additional protection. The maximum speed without protection is calculated as follows: Rotary synchronous motors: $p1082 \text{ [rpm]} \leq 11.695 * p0297/p0316 \text{ [Nm/A]}$ Linear motors: $p1082 \text{ [m/min]} \leq 73.484 * p0297/p0316 \text{ [N/A]}$ Rotary synchronous motors connected to a high-frequency converter: $p1082 \text{ [rpm]} \leq 4.33165 * (-p0316 + \text{square root}(p0316^2 + 4.86E-9 * (p0297 * r0313)^2 * (r0377 - r0233) \text{ [mH]} * r0234 \text{ [\mu F]})) / (p0297 * r0313^2 * (r0377 - r0233) \text{ [mH]} * r0234 \text{ [\mu F]})$ Linear motor connected to a high-frequency converter: $p1082 \text{ [m/min]} \leq 0.6894 * (-p0316 + \text{square root}(p0316^2 + 1.91865E-7 * (p0297 * r0313 * 3.1415)^2 * (r0377 - r0233) \text{ [mH]} * r0234 \text{ [\mu F]})) / (p0297 * r0313^2 * (r0377 - r0233) \text{ [mH]} * r0234 \text{ [\mu F]})$ Rotary induction motor connected to a high-frequency converter: $p1082 \text{ [rpm]} \leq \text{Maximum}(2.11383E5 / (r313 * \text{square root}((r0377 \text{ [mH]} + r0382 \text{ [mH]} * r0234 \text{ [\mu F]})) ; 0.6364 * p0297 * p0311 \text{ [rpm]} / p0304)$ - use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801) (only for synchronous motors). When using a synchronous motor with VPM connected to a high-frequency converter, the following must apply: $p1082 \text{ [rpm]} \leq p0348 * (r0377 + p0233) / p0233$ When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" (STO) must be connected to the VPM. When using a VPM, p0643 must be set to 1. - activating the internal voltage protection (IVP) with $p1231 = 3$ (only for synchronous motors). <b>Message value:</b>	%1
<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	NONE (OFF1, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The changeover to closed-loop control with encoder is not possible as the encoder has not been unparked.
<b>Remedy:</b>	- check whether the encoder firmware supports the "parking" function ( $r0481.6 = 1$ ). - upgrade the firmware. Note: For long-stator motors ( $p3870.0 = 1$ ), the following applies: The encoder must have completed the unparking procedure ( $r3875.0 = 1$ ) before a changeover can be made to closed-loop control with encoder. The encoder is unparked using binector input $p3876 = 0/1$ signal and remains until a 0 signal in this state.

**Message value:** -

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** OFF1 (OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The ratio between the multiturn resolution and the modulo range (p2576) is not an integer number.  
This results in the adjustment being set back, as the position actual value cannot be reproduced after power-off/power-on.

**Remedy:** Make the ration between the multiturn resolution and the modulo range an integer number.  
The ratio  $v$  is calculated as follows:

1. Motor encoder without position tracking:  
 $v = (p0421 * p2506 * p0433 * p2505) / (p0432 * p2504 * p2576)$
2. Motor encoder with position tracking for the measuring gear:  
 $v = (p0412 * p2506 * p2505) / (p2504 * p2576)$
3. Motor encoder with position tracking for the load gear:  
 $v = (p2721 * p2506 * p0433) / (p0432 * p2576)$
4. Motor encoder with position tracking for the load and measuring gear:  
 $v = (p2721 * p2506) / p2576$
5. Direct encoder without position tracking:  
 $v = (p0421 * p2506 * p0433) / (p0432 * p2576)$
6. Direct encoder with position tracking for the measuring gear:

<b>Reaction:</b>	OFF1 (OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "adjustment absolute measuring system" status is reset. Fault value (r0949, interpret decimal): 1: The position actual value (r2521) has exceeded the value range. 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range. 3: The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value. Note: For a linear encoder, the following must be maintained: - $p0407 * p2503 / (2^{p0418} * 10^7) < 1$ - $p0407 * p2503 / (2^{p0419} * 10^7) < 1$

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** If required, reduce the traversing range or position resolution (p2506).  
Increase the fine resolution of absolute position actual value (p0419).  
Note for fault value = 3:  
If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow.  
For rotary encoders, the maximum possible absolute position (LU) is calculated as follows:

1. Motor encoder without position tracking  
 $p2506 * p0433 * p2505 / (p0432 * p2504)$   
 $p2506 * p0433 * p2505 * p0421 / (p0432 * p2504)$  for multiturn encoders
2. Motor encoder with position tracking for measuring gear:  
 $p2506 * p0412 * p2505 / p2504$
3. Motor encoder with position tracking for load gear  
 $p2506 * p2721 * p0433 / p0432$
4. Motor encoder with position tracking for load and measuring gear  
 $p2506 * p2721$
5. Direct encoder without position tracking

**Cause:** When evaluating the measuring probe, an error occurred.

Alarm value (r2124, interpret decimal):

6: The input terminal for the measuring probe is not set.

4098: Error when initializing the measuring probe.

4100: The measuring pulse frequency is too high.

> 50000: The measuring clock cycle is not a multiple integer of the position controller clock cycle.

**Remedy:** De-activate the measuring probe evaluation (BI: p2509 = 0 signal).

Re alarm value = 6:

Set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518).

Re alarm value = 4098:

Check the Control Unit hardware.

Re alarm value = 4100:

Reduce the frequency of the measuring pulses at the measuring probe.

Re alarm value > 50000:

Set the clock cycle ratio of the measuring clock cycle to the position controller clock cycle to an integer multiple.

To do this, the currently effective measuring clock cycle can be determined from the alarm value as follows:

$T_{\text{meas}} [125 \mu\text{s}] = \text{alarm value} - 50000$

With PROFIBUS, the measuring clock cycle corresponds to the PROFIBUS clock cycle (r2064[1]).

Without PROFIBUS, the measuring clock cycle is an internal cycle time that cannot be influenced.

#### **F07545 Drive: Pulse encoder interface parameterized incorrectly**

**Message value:** %1

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The pulse encoder interface has been parameterized incorrectly. Fault value (r0949, interpret decimal):

1:

The encoder type setting for encoder interface 1 or 2 is not the same for all data sets. Accordingly, the following parameter assignment, for example, would generate a fault:  
p0187[0] = 0: Encoder data set 0 is assigned to drive data set 0.  
p0187[1] = 1: Encoder data set 1 is assigned to drive data set 1.  
p0400[0] = 9000: A value of 9000 (pulse encoder) is set in encoder data set 0.  
p0400[1] = 2001: A value of 2001 (sin/cos encoder) is set in encoder data set 1.

2:

The setting in p0400 is not compatible with the telegram selection made in p0922 and p2079.

3:

A second encoder interface can only be used for pulse encoders (p0184 > 0).

**Remedy:** For fault value = 1:

- make the encoder type setting for encoder interface 1 or 2 the same for all data sets.

For fault value = 2:

- if applicable, do not set parameter p0400 to 9000 or 9001

- if you are using the pulse encoder interface (p0400 = 9000, 9001), set up a free telegram configuration first (p0922 = 999 and p2079 = 999)

For fault value = 3:

- Check the setting for the second encoder interface (p0184).

The motor encoder used does not supply an absolute commutation angle.  
yyyy = 2 dec:  
The selected ratio of the measuring gear does not match the motor pole pair number.

**Remedy:** Re fault cause = 1:  
- check the encoder parameterization (p0404).  
- use an encoder with track C/D, EnDat interface of Hall sensors.  
- use an encoder with sinusoidal A/B track for which the motor pole pair number (r0313) is an integer multiple of the encoder pulse number (p0408).  
- activate the pole position identification routine (p1982 = 1).  
Re fault cause = 2:  
- the quotient of the pole pair number divided by the ratio of the measuring gear must be an integer number: (p0314 \* p0433) / p0432.  
Note:  
For operation with track C/D, this quotient must be less than 8.

**Reaction:** OFF2 (IASC/DCBRAKE, NONE, OFF1, OFF3, STOP1, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:**  
For position tracking, the configuration is not supported.  
Position tracking can only be activated for absolute encoders.  
For linear axes, it is not possible to simultaneously activate the position tracking for load and measuring gears.  
Fault value (r0949, interpret hexadecimal):

ddccbbaa hex

aa = encoder data set

bb = component number

cc = drive data set

dd = fault cause

dd = 00 hex = 0 dec

An absolute encoder is not being used.

dd = 01 hex = 1 dec

Position tracking cannot be activated because the memory of the internal NVRAM is not sufficient or a Control Unit does not have an NVRAM.

dd = 02 hex = 2 dec

For a linear axis, the position tracking was activated for the load and measuring gear.

dd = 03 hex = 3 dec

Position tracking cannot be activated because position tracking with another gear ratio, axis type or tolerance window has already been detected for this encoder data set.

dd = 04 hex = 4 dec

A linear encoder is being used.

See also: p0404 (Encoder configuration effective)

**Remedy:**

- use an absolute encoder.

- if necessary, de-select the position tracking (p0411 for the measuring gear, p2720 for the load gear).

- use a Control Unit with sufficient NVRAM.

- Only activate position tracking of the load gear in the same encoder data set if the gear ratio (p2504, p2505), axis type (p2720.1) and tolerance window (p2722) are also the same.

- Reaction:** NONE
- Acknowledge:** IMMEDIATELY
- Cause:** The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum).

Fault value (r0949, interpret decimal):

Number of the incorrect parameter.

See also: r0200 (Power unit code number actual), p0201 (Power unit code number)

**Remedy:** Connect the original power unit and power up the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0.

For infeeds, the following applies:

Line reactors or line filters must be used that are specified for the new power unit. A line supply and DC link identification routine (p3410 = 5) must then be carried out. It is not possible to change the power unit without re-commissioning the system if the type of infeed (A\_Infeed, B\_Infeed, S\_Infeed), the type of construction/design (booksize, chassis) or the voltage class differ between the old and new power units.

For inverters, the following applies:

If the new power unit is accepted, then if required, the current limit (p0640) can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same).

If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ.

If the comparison stage in p9906 is set to 2, 3, then commissioning can be exited (p0010 = 0) and the fault acknowledged.

5: Component with sensor evaluation not present or has been removed in the meantime.

6: Evaluation via Motor Module not possible (r0192.21).

**Remedy:** Re alarm value = 1:

- In p0600 set an encoder with temperature sensor.

Re alarm value = 2:

- interconnect p0603 with the temperature signal.

Re alarm value = 3, 4:

- set the available temperature sensor (p0600, p0601).

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The armature short-circuit is incorrectly parameterized.

Fault value (r0949, interpret decimal):

zzzyyxx: zzzz = fault cause, xx = motor data set

zzzz = 1: A permanent-magnet synchronous motor has not been selected.

zzzz = 2: An induction motor has not been selected.

zzzz = 101: External armature short-circuit: Output (r1239.0) not connected up.

zzzz = 102: External armature short-circuit with contactor feedback signal: No feedback signal connected (BI:p1235).

zzzz = 103: External armature short-circuit without contactor feedback signal: Delay time when opening (p1237) is 0.

zzzz = 201: Internal voltage protection: The maximum output current of the Motor Module (r0209) is less than 1.8 x motor short-circuit current (r0331).

zzzz = 202: Internal voltage protection: A Motor Module in booksize or chassis format is not being used.

zzzz = 203: Internal voltage protection: The motor short-circuit current (p0320) is greater than the maximum motor current (p0323).

zzzz = 204: Internal voltage protection: The activation (p1231 = 4) is not given for all motor data sets with synchronous motors (p0300 = 2xx, 4xx).

- Remedy:**
- For fault value = 1:
    - an armature short-circuit / voltage protection is only permissible for permanent-magnetic synchronous motors. The highest position of the motor type in p0300 must either be 2 or 4.
  - For fault value = 101:
    - the contactor for the external armature short-circuit configuration should be controlled using output signal r1239.0. The signal can, e.g. be connected to an output terminal via binector input p0738. Before this fault can be acknowledged, p1231 must be set again.
  - For fault value = 102:
    - if the external armature short-circuit with contactor feedback signal (p1231 = 1) is selected, this feedback signal must be connected to an input terminal (e.g. r722.x) and then connected to BI: p1235.
    - alternatively, the external armature short-circuit without contactor feedback signal (p1231 = 2) can be selected.
  - For fault value = 103:
    - if the external armature short-circuit without contactor feedback signal (p1231 = 2) is selected, then a delay time must be parameterized in p1237. This time must always be greater than the actual contactor opening time, as otherwise the Motor Module would be short-circuited!
  - For fault value = 201:
    - a Motor Module with a higher maximum current or a motor with a lower short-circuit current must be used. The maximum Motor Module current must be higher than 1.8 x short-circuit current of the motor.
  - For fault value = 202:
    - for internal voltage protection, use a Motor Module in booksize or chassis format.
  - For fault value = 203:
    - for internal voltage protection, only use short-circuit proof motors.
  - For fault value = 204:
    - The internal voltage protection must either be activated for all motor data sets with synchronous motors (p0300 = 2xx, 4xx) (p1231 = 3) or it must be de-activated for all motor data sets (p1231 not equal to 3). This therefore ensures that the protection cannot be accidentally withdrawn as a result of a data set changeover. The fault can only be acknowledged if this condition is fulfilled.

#### **Internal armature short-circuit: Motor terminals are not at zero potential after pulse suppression**

- Message value:** -
- Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN
- Reaction:** NONE
- Acknowledge:** IMMEDIATELY
- Cause:** The function "Internal voltage protection" (p1231 = 3) was activated.
- The following must be observed:
- when the internal voltage protection is active, after pulse suppression, all of the motor terminals are at half of the DC link voltage (without an internal voltage protection, the motor terminals are at zero potential)!
  - it is only permissible to use motors that are short-circuit proof (p0320 < p0323).
  - the Motor Module must be able to continually conduct 180% short-circuit current (r0331) of the motor (r0289).
  - the internal voltage protection cannot be interrupted due to a fault response. If an overcurrent condition occurs during the active, internal voltage protection, then this can destroy the Motor Module and/or the motor.
  - if the Motor Module does not support the autonomous, internal voltage protection (r0192.10 = 0), in order to ensure safe, reliable functioning when the line supply fails, an external 24 V power supply (UPS) must be used for the components.
  - if the Motor Module does support the autonomous, internal voltage protection (r0192.10 = 1), in order to ensure safe, reliable functioning when the line supply fails, the 24 V power supply for the components must be provided through a Control Supply Module.
  - if the internal voltage protection is active, it is not permissible that the motor is driven by the load for a longer period of time (e.g. as a result of loads that move the motor or another coupled motor).
- Remedy:** Not necessary.
- This a note for the user.

<b>Cause:</b>	The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal voltage protection is selected (p1231 = 3).
<b>Remedy:</b>	If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module automatically decides - using the DC link voltage - as to whether the armature short-circuit should be activated. The armature short-circuit is activated and response OFF2 is initiated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the armature short-circuit is withdrawn. If the motor is still in a critical speed range, the armature short-circuit is re-activated once the DC link voltage exceeds the threshold of 800 V. If the autonomous (independent) internal voltage protection is active (r1239.5 = 1) and the line supply returns (450 V < DC link voltage < 800 V), the armature short-circuit is withdrawn after 3 minutes.

<b>Cause:</b>	The Control Unit has detected a brake control error. Fault value (r0949, interpret decimal): 10, 11: Fault in "open holding brake" operation. - No brake connected or wire breakage (check whether brake releases for p1278 = 1). - Ground fault in brake cable. 20: Fault in "brake open" state. - Short-circuit in brake winding. 30, 31: Fault in "close holding brake" operation. - No brake connected or wire breakage (check whether brake releases for p1278 = 1). - Short-circuit in brake winding. 40: Fault in "brake closed" state. 50: Fault in the brake control circuit of the Control Unit or communication fault between Control Unit and Motor Module (brake control diagnostics). 80: When using the Safe Brake Adaptor (SBA), a fault has occurred in the brake control of the Control Unit. Note: The following causes may apply to fault values: - motor cable is not shielded correctly. - defect in control circuit of the Motor Module. See also: p1278 (Brake control diagnostics evaluation)

- Remedy:**
- check the motor holding brake connection.
  - check the function of the motor holding brake.
  - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
  - check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
  - replace the Motor Module involved.
- Operation with Safe Brake Module:
- check the Safe Brake Modules connection.
  - replace the Safe Brake Module.

1: More than one motor holding brake has been assigned (p1215 = 1 or 2 on more than one S120 Combi feed drive) - or there is more than one DRIVE-CLiQ motor with motor holding brake.  
2: Brake was accidentally assigned to the spindle (p1215 = 1); this is not permitted.  
3: An attempt was made to enable the function "Safe brake control" (SBC, p9602 = p9802 = 1) for the spindle. This is not permitted.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** Check whether the motor holding brake has been assigned to one S120 Combi feed drive exclusively (p1215 = 1 or 2) and not the spindle.  
The fault will only be withdrawn once the motor holding brake has been assigned to just one of the S120 Combi feed drives and not the spindle (p1215 = 1 or 2 for this one drive). From this point, the motor holding brake will be controlled by this drive.

Only the parameterized current limit (p0640) and the maximum speed (p1082) are effective. The behavior of the motor can be influenced using the direction inhibit (p1959.14, p1959.15) and the ramp-up/ramp-down time (p1958).

The rotating measurement is carried out at the next power-on command.

50: With the selected current controller sampling rate, the pulse frequency cannot be implemented.

**Note:**

Percentage values are referred to the rated motor impedance:

$Z_n = V_{mot,nom} / \sqrt{3} / I_{mot,nom}$

101: Voltage amplitude even at 30% maximum current amplitude is too low to measure the inductance.

102, 104: Voltage limiting while measuring the inductance.

103: Maximum frequency exceeded during the rotating inductance measurement.

- 110: Motor not finely synchronized before the rotating measurement.
- 111: The zero mark is not received within 2 revolutions.
- 112: Fine synchronization is not realized within 8 seconds after the zero mark has been passed.
- 113: The power, torque or current limit is zero.
- 115: U/f control is active.
- 120: Error when evaluating the magnetizing inductance.
- 125: Cable resistance greater than the total resistance.
- 126: Series inductance greater than the total leakage inductance.
- 127: Identified leakage inductance negative.
- 128: Identified stator resistance negative.
- 129: Identified rotor resistance negative.
- 130: Drive data set changeover during the motor data identification routine.
- 140: The setpoint channel inhibits both directions.
- 160: Accelerating when determining kT, moment of inertia or reluctance torque too short or the accelerating time is too long.
- 173: Internal problem.
- 180: Identification speed (maximum speed, rated speed,  $0.9 \times p0348$ ) less than p1755.
- 190: Speed setpoint not equal to zero.
- 191: An actual speed of zero is not reached.
- 192: Speed setpoint not reached.
- 193: Inadmissible motion of the motor when identifying the voltage emulation error.
- 194: Supplementary torque (r1515) not equal to zero.
- 195: Closed-loop torque control active.
- 200, 201: Not possible to identify the voltage emulation error characteristic of the drive converter (p1952, p1953).

**Remedy:**

- For fault value = 0:
  - check whether the motor is correctly connected. Observe configuration (star-delta).
- Re fault value = 1 ... 40:
  - check whether motor data have been correctly entered in p0300, p0304 ... p0311.
  - is there an appropriate relationship between the motor power rating and that of the Motor Module? The ratio of the Motor Module to the rated motor current should not be less than 0.5 and not be greater than 4.
  - check configuration (star-delta).
- For fault value = 2:
  - for parallel circuits, check the motor winding system in p7003. If, for power units connected in parallel, a motor is specified with a single-winding system (p7003 = 0), although a multi-winding system is being used, then a large proportion of the stator resistance is interpreted as feeder cable resistance and entered in p0352.
- Re fault value = 4, 7:
  - check whether inductances are correctly entered in p0233 and p0353.
  - check whether motor has been correctly connected (star-delta).
- For fault value = 50:
  - reduce the current controller sampling rate.
- For fault value = 101:
  - increase current limit (p0640) or torque limit (p1520, p1521).
  - check current controller gain (p1715).
  - reduce current controller sampling time (p0115).
- It may be impossible to completely identify the L characteristic, as required current amplitude is too high.
  - suppress meas. (p1909, p1959).
- Re fault value = 102, 104:
  - reduce current limit (p0640).
  - check current controller P gain.
  - suppress meas. (p1909, p1959).
- For fault value = 103:
  - increase external moment of inertia (if possible).
  - reduce current controller sampling time (p0115).
  - suppress meas. (p1909, p1959).
- For fault value = 110:
  - before rotating measurement, traverse motor over zero mark.

For fault value = 111:

- it is possible that encoder does not have zero mark. Correct setting in p0404.15.
- encoder pulse number was incorrectly entered. Correct setting in p0408.
- if zero mark signal is defective, replace encoder.

For fault value = 112:

- upgrade encoder software.

For fault value = 113:

- check the limits (p0640, p1520, p1521, p1530, p1531), correct the zero values.

For fault value = 115:

- de-select U/f control (p1317 = 0).

For fault value = 120:

- check current controller P gain (p1715) and if required, reduce.
- increase the pulse frequency (p1800).

For fault value = 125:

- reduce cable resistance (p0352).

For fault value = 126:

- reduce series inductance (p0353).

Re fault = 127, 128, 129:

- it is possible that current controller is oscillating. Reduce p1715 before next measurement.

For fault value = 130:

- do not initiate a drive data set changeover during motor ident. routine.

For fault value = 140:

- before the measurement, enable at least one direction (p1110 = 0 or p1111 = 0 or p1959.14 = 1 or p1959.15 = 1).

For fault value = 160:

- extend accelerating time when determining kT, moment of inertia and reluctance torque, e.g. by increasing max. speed (p1082), increasing moment of inertia or reducing max. current (p0640).
- in encoderless operation with load moment of inertia, parameterize the load moment of inertia (p1498).
- reduce the ramp-up time (p1958).
- increase speed controller P-gain (p1460).
- suppress meas. (p1959).

For fault value = 173:

-

For fault value = 180:

- increase max. speed (p1082).
- reduce p1755.
- suppress meas. (p1909, p1959).

For fault value = 190:

- set speed setpoint to zero.

For fault value = 191:

- do not start motor data identification routine while motor is still rotating.

For fault value = 192:

- check closed-loop speed control (motor rotor may be locked or closed-loop speed control is not functioning).
- for p1215 = 1, 3 (brake the same as the sequence control) check the control sense (p0410.0).
- ensure that enable signals are present during measurement.
- remove any pulling loads from motor.
- increase max. current (p0640).
- reduce max. speed (p1082).
- suppress meas. (p1959).

For fault value = 193:

- the motor has moved through more than 5 ° electrical (r0093). Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/-5 °) and then start identification.

For fault value = 194:

- switch out all supplementary torques (e.g. CI: p1511).
- for hanging/suspended axes: Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/-1 °) and then start identification.

For fault value = 195:

- de-select closed-loop torque control (p1300 = 21 or 20, or set the signal source in p1501 to a 0 signal).

Re fault value = 200, 201:

- set pulse frequency to 0.5 x current controller frequency (e.g. 4 kHz for a current controller clock cycle of 125 us).

- reduce cable length between Motor Module and motor.

- read-out measured values (r1950, r1951) and therefore determine suitable values for p1952, p1953 according to your own estimation.

<b>Cause:</b>	The motor data identification routine is activated. The motor data identification routine is carried out at the next power-on command. See also: p1910 (Motor data identification routine stationary (standstill)), p1960 (Rotating measurement selection)
<b>Remedy:</b>	Not necessary. The alarm automatically disappears after the motor data identification routine has been successfully completed or for the setting p1910 = 0 or p1960 = 0. If a POWER ON or a warm restart is performed with motor data identification selected, the motor data identification request will be lost. If motor data identification is required, it will need to be selected again manually following ramp-up.

<b>F07993</b>	<b>Drive: Incorrect direction of rotation of the field or encoder actual value inversion</b>
<b>Message value:</b>	-
<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	OFF2 (NONE)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Either the direction of the rotating field or the encoder actual value has an incorrect sign. The motor data identification automatically changed the actual value inversion (p0410) in order to correct the control sense. This can result in a direction of rotation change. Note: To acknowledge this fault, the correctness of the direction of rotation must first be acknowledged with p1910 = -2.
<b>Remedy:</b>	Check the direction of rotation (also for the position controller, if one is being used). If the direction of rotation is correct, the following applies: No additional measures are required (except set p1910 = -2 and acknowledge fault). If the direction of rotation is incorrect, the following applies: To change the direction of rotation, two phases must be interchanged and the motor identification routine must be repeated.

It is possible that all measured values are identical. The expected deflection was not able to be reached, either because the expectation is too high or not enough current was able to be established.
- 208: Elasticity-based pole position identification, measuring current is 0.
- 209: Elasticity-based pole position identification, the selected max. distance was exceeded (p3095).
- 210: Elasticity-based pole position identification without encoder.
- 250 ... 260:  
Elasticity-based pole position identification, more than 3 attempts have been made and fault value 200 ... 210 output.

Example:

Fault value= 253 --> more than 3 attempts have been made and fault value 203 output.

#### Remedy:

For fault value = 1:

- check the motor connection and DC link voltage.
- for the following parameters, set practical values that are not zero (p0325, p0329).

Re fault value = 1, 2:

- in the case of a large computing time load (e.g., 6 drives with Safety Integrated), set the computing dead time of the current controller to late transfers (p0117 = 3).

For fault value = 3:

- increase the max. distance (p1981).
- reduce the currents for the pole position identification routine (p0325, p0329).
- stop the motor in order to carry out the pole position identification routine.

For fault value = 5:

- reduce the currents for the pole position identification routine (p0325, p0329).

For fault value = 6:

- re-calibrate the Motor Module.

For fault value = 8:

- reduce the currents for the pole position identification routine (p0329, p0325, p1993).
- the power unit cannot provide the necessary pole position identification routine current (p0209 < p0329, p0325, p1993), replace the power unit with a power unit with a higher max. current.

For fault value = 9:

- enter a value not equal to zero in the pole position identification routine current (p0329, p0325, p1993).

For fault value = 10:

- do not initiate a data set changeover during the pole position identification.

For fault value = 11:

- for incremental encoders without commutation with zero mark (p0404.15 = 0), it does not make sense to adjust the encoder to determine the commutation angle (p1990 = 1). In this case, the function should be de-selected (p1990 = 0) or, for an encoder with suitable zero mark, commutation with zero mark should be selected (p0404.15 = 1).
- for absolute encoders, only adjust the encoder to determine the commutation angle (p1990 = 1) if the encoder supplies commutation information and is finely synchronized (p1992.8 = 1 and p1992.10 = 1). The encoder is possibly parked, de-activated (p0145), not ready for operation or signals a fault condition.
- de-select the encoder adjustment to determine the commutation angle (set p1990 to 0).

Re fault value = 40 ... 49:

- increase the currents for the pole position identification routine (p0325, p0329).
- stop the motor in order to carry out the pole position identification routine.
- select another technique for pole position identification routine (p1980).
- use another motor, absolute encoder or Hall sensors.

Re fault value = 70 ... 79:

- upgrade the software in the Sensor Module.

Re fault value = 100, 101:

- check and ensure that the motor is free to move.
- increase the current for motion-based pole position identification (p1993).

For fault value = 102:

- if the motor is to be operated with a brake: Select a different technique to identify the pole position (p1980).
- if the motor can be operated without a brake: Open the brake (p1215 = 2).

For fault value = 103:

- the motion-based pole position identification can only be carried out using an encoder. Connect an encoder or select another technique for pole position identification routine (p1980).

For fault value = 104:

- pole position identification, increase the smoothing time, motion-based (p1997).
- pole position identification, increase the rise time, motion-based (p1994).
- pole position identification, check the gain, motion-based (p1995).
- pole position identification, check the integral time, motion-based (p1996).
- for motor encoders with track A/B sq-wave (p0404.3 = 1) and flank time measurement (p0430.20 = 0), disable the integral time (p1996 = 0).

For fault value = 200:

- check parameter setting (p3090 ... p3096).

For fault value = 201:

- check parameter setting (p3090 ... p3096).
- reduce p3094.

For fault value = 202:

- check parameter setting (p3090 ... p3096).
- fault has occurred during the identification. Repeat the measurement.
- check the brake or brake control.

For fault value = 203:

- check the brake or brake control.
- check the measuring current (p3096).
- increase p3094.

For fault value = 204:

- check parameter setting (p3090 ... p3096).

For fault value = 205:

- check parameter setting (p3090 ... p3096).

For fault value = 206:

- check parameter setting (p3090 ... p3096).
- fault has occurred during the identification. Repeat the measurement.
- check the brake or brake control.

For fault value = 207:

- reduce the expected deflection (p3094).
- increase the measuring current (p3096).

## 4 Faults and alarms

### 4.2 List of faults and alarms

For fault value = 208:

- set the measuring current (p3096).

For fault value = 209:

- check parameter setting p3095.

- check the brake or brake control.

For fault value = 210:

- the elasticity-based pole position identification can only be carried out using an encoder. Connect an encoder or select another technique for pole position identification routine (p1980).

Re fault value = 250 ... 260:

- check parameter setting (p3090 ... p3096, p1980).

<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	ENCODER (OFF2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	In operation, the operating mode that requires a pole position identification was changed over, which is not possible in this state.  - the drive was changed over, flying, from encoderless operation to operation with encoder without having previously carried out a pole position identification for the encoder. p1404 is then at a value between zero and the max. speed and the pulses in the speed range above p1404 were enabled without a pole position ident. routine having been previously carried out in operation with encoder.  - in operation, an EDS changeover was made to an encoder where it is necessary to carry out a pole position identification. However, this has still not been carried out (p1982 = 1 or 2 and p1992.7 = 0).
<b>Remedy:</b>	- for a flying changeover between operation with and without encoder with pole position identification after POWER ON or commissioning (p0010 not equal to zero) enable the pulses once at zero speed. This means that the pole position identification routine is carried out and the result is available for operation.  - carry out the EDS changeover with the pulses inhibited, or, before the changeover, carry out a pole position identification using this data set.

<b>A08755</b>	<b>CAN: Obj cannot be mapped</b>
<b>Message value:</b>	-
<b>Drive object:</b>	All objects
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The CANopen object is not provided for the Process Data Object (PDO) Mapping.
<b>Remedy:</b>	Use a CANopen object intended for the PDO mapping or enter 0. The following objects can be mapped in the Receive Process Data Object (RPDO) or Transmit Process Data Object (TPDO): - RPDO: 6040 hex, 6060 hex, 60FF hex, 6071 hex; 5800 hex - 580F hex; 5820 hex - 5827 hex - TPDO: 6041 hex, 6061 hex, 6063 hex, 6069 hex, 606B hex, 606C hex, 6074 hex; 5810 hex - 581F hex; 5830 hex - 5837 hex Only sub-index 0 of the specified objects can be mapped. Note: As long as A08755 is present, the COB-ID cannot be set to valid.

---

<b>A08756</b>	<b>CAN: Number of mapped bytes exceeded</b>
<b>Message value:</b>	-
<b>Drive object:</b>	All objects
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The number of bytes of the mapped objects exceeds the telegram size for net data. A max. of 8 bytes is permissible.
<b>Remedy:</b>	Map fewer objects or objects with a smaller data type. See also: p8710, p8711, p8712, p8713, p8714, p8715, p8716, p8717, p8730, p8731, p8732, p8733, p8734, p8735, p8736, p8737

---

<b>A08757</b>	<b>CAN: Set COB-ID invalid</b>
<b>Message value:</b>	-
<b>Drive object:</b>	All objects
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	For online operation, the appropriate COB-ID must be set invalid before mapping. Example: Mapping for RPDO 1 should be changed (p8710[0]). --> set p8700[0] = C00006E0 hex (invalid COB-ID) --> set p8710[0] as required. --> p8700[0] enter a valid COB-ID
<b>Remedy:</b>	Set the COB-ID to invalid.

---

<b>A08759</b>	<b>CAN: PDO COB-ID already available</b>
<b>Message value:</b>	-
<b>Drive object:</b>	All objects
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	An existing PDO COB-ID was allocated.
<b>Remedy:</b>	Select another PDO COB-ID.

<b>A13000</b>	<b>License not adequate</b>
<b>Message value:</b>	%1
<b>Drive object:</b>	All objects
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	- for the drive unit, the options that require a license are being used but the licenses are not sufficient. - an error occurred when checking the existing licenses.

Alarm value (r2124, interpret decimal):

0:

The existing license is not sufficient.

1:

An adequate license was not able to be determined as the memory card with the required licensing data was withdrawn in operation.

2:

An adequate license was not able to be determined as there is no licensing data available on the memory card.

3:

An adequate license was not able to be determined as there is a checksum error in the license key.

4:

An internal error occurred when checking the license.

**Remedy:**

Re alarm value = 0:

Additional licenses are required and these must be activated (p9920, p9921).

Re alarm value = 1:

With the system powered down, re-insert the memory card that matches the system.

Re alarm value = 2:

Enter and activate the license key (p9920, p9921).

Re alarm value = 3:

Compare the license key (p9920) entered with the license key on the certificate of license.

Re-enter the license key and activate (p9920, p9921).

Re alarm value = 4:

- carry out a POWER ON.
- upgrade firmware to later version.
- contact the Hotline.

**A13001 Error in license checksum**

**Message value:**

-

**Drive object:**

All objects

**Reaction:**

NONE

**Acknowledge:**

NONE

**Cause:**

When checking the checksum of the license key, an error was detected.

**Remedy:**

Compare the license key (p9920) entered with the license key on the certificate of license.  
Re-enter the license key and activate (p9920, p9921).

**F13010 Licensing function module not licensed**

**Message value:**

%1

**Drive object:**

All objects

**Reaction:**

OFF1

**Acknowledge:**

IMMEDIATELY

**Cause:**

At least one function module which is under license does not have a license.

Fault value (r0949, interpret hexadecimal):

Bit x = 1: The corresponding function module does not have a license.

Note:

Refer to p0108 or r0108 for the assignment between the bit number and function module.

**Remedy:**

- enter and activate the license key for function modules under license (p9920, p9921).
  - if necessary, de-activate unlicensed function modules (p0108, r0108).
- See also: p9920 (Licensing enter license key), p9921 (Licensing activate license key)

Fault value (r0949, interpret decimal):  
DC link voltage at the time of trip [0.1 V].

**Remedy:**

- increase the ramp-down time
- activate the DC link voltage controller
- use a brake resistor or Active Line Module
- increase the current limit of the infeed or use a larger module (for the Active Line Module)
- check the device supply voltage
- check and correct the phase assignment at the VSM and at the power unit
- check the line supply phases.

**F30003 Power unit: DC link voltage undervoltage**

**Message value:**

-

**Drive object:**

SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:**

OFF2

**Acknowledge:**

IMMEDIATELY

**Cause:**

The power unit has detected an undervoltage condition in the DC link.

- line supply failure
- line supply voltage below the permissible value.
- line supply infeed failed or interrupted.
- line phase interrupted.

**Note:**

The monitoring threshold for undervoltage in the DC link is indicated in r0296.

**Remedy:**

- check the line supply voltage
- check the line supply infeed and observe the fault messages relating to it (if there are any)
- check the line supply phases.
- check the line supply voltage setting (p0210).
- booksized units: check the setting of p0278.

**Note:**

The ready signal for the infeed (r0863) must be interconnected to the associated drive inputs (p0864).

%1

**Drive object:**

SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:**

OFF2

**Acknowledge:**

IMMEDIATELY

**Cause:**

The temperature of the power unit heat sink has exceeded the permissible limit value.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

Fault value (r0949):

Temperature [1 bit = 0.01 °C].

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.

**Notice:**

This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.

<b>F30005</b>	<b>Power unit: Overload I2t</b>
<b>Message value:</b>	%1
<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The power unit was overloaded (r0036 = 100 %). - the permissible rated power unit current was exceeded for an inadmissibly long time. - the permissible load duty cycle was not maintained. Fault value (r0949, interpret decimal): I2t [100 % = 16384].
<b>Remedy:</b>	- reduce the continuous load. - adapt the load duty cycle. - check the motor and power unit rated currents. See also: r0036 (Power unit overload I2t), r0206 (Rated power unit power), p0307 (Rated motor power)

<b>Message value:</b>	-
<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	OFF2 (OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	At the power unit, the DC link voltage ripple has exceeded the permissible limit value. Possible causes: - A line phase has failed. - The 3 line phases are inadmissibly unsymmetrical. - The capacitance of the DC link capacitor forms a resonance frequency with the line inductance and the reactor integrated in the power unit. - the fuse of a phase of a main circuit has ruptured. - A motor phase has failed.
<b>Remedy:</b>	- check the main circuit fuses. - Check whether a single-phase load is distorting the line voltages. - Detune the resonant frequency with the line inductance by using an upstream line reactor. - Dampen the resonant frequency with the line inductance by switching over the DC link voltage compensation in the software (see p1810) – or increase the smoothing (see p1806). However, this can have a negative impact on the torque ripple at the motor output. - check the motor feeder cables.

---

**Remedy:**

Re fault cause = 0:  
If required, deactivate an active internal voltage protection (p1231).

Re fault cause = 1:  
Update the Control Unit firmware or change the DRIVE-CLiQ topology.

Re fault cause = 2:  
Replace the power unit with a PM260 with PS-ASIC version 3 (or higher).

Re fault cause = 3, 4:  
Insert a Control Unit or Control Unit Adapter (CUAxx) on an appropriate Power Module and perform a POWER ON for the Control Unit or the Control Units Adapter.

Re fault cause = 5:  
- use a booksize format power unit.  
- for a Double Motor Module operate the two drive controls with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time.  
- If required, de-select the higher current controller dynamic performance (p1810.11 = 0). After deselecting the computing dead time, recalculate the controller gains (p0340 = 4). If required, optimize the speed controller.

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** Power unit has detected a ground fault.  
- ground fault in the power cables.  
- winding fault or ground fault at the motor.  
- CT defective.  
Additional cause for CU310/CUA31:  
- when the brake is applied, this causes the hardware DC current monitoring to respond.  
Additional cause for parallel switching devices (r0108.15 = 1):  
- the closed-loop circulating current control is either too slow or has been set too fast.  
Fault value (r0949, interpret decimal):  
Absolute value, total current amplitude [20479 = r0209 x 1.4142].  
Note:

For power units, a ground fault is also emulated in r3113.5.

**Remedy:**

- check the power cable connections.
- check the motor.
- check the CT.

The following applies additionally for CU310/CUA31:

- check the cables and contacts of the brake connection (a wire is possibly broken).

For parallel switching devices (r0108.15 = 1) the following additionally applies:

- check the ground fault monitoring thresholds (p0287).
- check the setting of the closed-loop circulating current control (p7036, p7037).

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The power unit DC link was not able to be pre-charged within the expected time.

- 1) There is no line supply voltage connected.
- 2) The line contactor/line side switch has not been closed.
- 3) The line supply voltage is too low.
- 4) Line supply voltage incorrectly set (p0210).
- 5) The pre-charging resistors are overheated as there were too many pre-charging operations per time unit.
- 6) The pre-charging resistors are overheated as the DC link capacitance is too high.
- 7) The pre-charging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link.
- 8) The pre-charging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.
- 9) The DC link has either a ground fault or a short-circuit.
- 10) The pre-charging circuit is possibly defective (only for chassis units).
- 11) Infeed is defective and/or fuse has ruptured in the Motor Module (only Booksize units).

Fault value (r0949, interpret binary):

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:**

In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).

For booksize drive units, the following applies:

- wait (approx. 8 minutes) until the pre-charging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

Re 5):

- carefully observe the permissible pre-charging frequency (refer to the appropriate Equipment Manual).

Re 6):

- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC-link capacitance if necessary (refer to the appropriate Equipment Manual)

Re 7):

- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link

Re 8):

- check the connections of the external line contactor. The line contactor must be open during DC-link fast discharge.

Re 9):

- check the DC link for ground faults or short circuits.

Re 11):

- Check the DC link voltage of the infeed (r0070) and Motor Modules (r0070).

If the DC link voltage generated by the infeed (or external) is not displayed for the Motor Modules (r0070), then a fuse has ruptured in the Motor Module.

#### **A30031 Power unit: Hardware current limiting in phase U**

**Message value:** -

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Hardware current limit for phase U responded. The pulsing in this phase is inhibited for one pulse period.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

**Note:**

Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.

**Remedy:**

- check the motor data and if required, recalculate the controller parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
- check the motor circuit configuration (star-delta)
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.

#### **F30036**      **Power unit: Internal overtemperature**

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** For chassis power units, the following applies:  
The temperature inside the drive converter has exceeded the permissible temperature limit.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.

Fault value (r0949, interpret binary):  
Bit 0 = 1: Overtemperature in the control electronics range.  
Bit 1 = 1: Overtemperature in the power electronics range.

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.

Notice:  
This fault can only be acknowledged once the permissible temperature limit minus 5 K has been fallen below.

**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** Power supply fault in the power unit.  
- The voltage monitor signals an undervoltage fault on the module.  
The following applies for CU31x:  
- the voltage monitoring on the DAC board signals an undervoltage fault on the module.  
**Remedy:**  
- check the 24 V DC voltage supply to power unit.  
- carry out a POWER ON (power off/on) for the component.  
- replace the module if necessary.

---

#### **A30046 (F) Power unit: Undervoltage alarm**

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** Before the last restart, a problem occurred at the power unit power supply.  
- the voltage monitor in the internal FPGA of the PSA signals an undervoltage fault on the module.  
Fault value (r0949):  
Register value of the voltage fault register.  
**Remedy:**  
- check the 24 V DC voltage supply to power unit.  
- carry out a POWER ON (power off/on) for the component.  
- replace the module if necessary.

Reaction upon F: NONE (OFF1, OFF2)

**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The feedback signal from the external fan indicates a fault.  
- fan faulty, blocked.  
- feedback signal inaccurate.  
**Remedy:**  
- check the external fan and replace if necessary.  
- if you are using an external fan with feedback, check its wiring (X12.2 or X13.2).  
Note:  
If you are using an external fan without feedback, check that the feedback terminal wiring on the power unit is connected to ground and make this connection if necessary (X12.1/2 or X13.1/2).

<b>Cause:</b>	The "Safety Integrated" function integrated on the Motor Module (MM) has detected a fault and initiated STOP A (pulse suppression via the safety shutdown path of the Motor Module). - forced checking procedure of the safety shutdown path of the Motor Module unsuccessful. - subsequent response to fault F30611 (defect in a monitoring channel).

## 4 Faults and alarms

### 4.2 List of faults and alarms

Fault value (r0949, interpret decimal):

0: Stop request from the Control Unit.

1005: Pulses suppressed although STO not selected and there is no internal STOP A present.

1010: Pulses enabled although STO is selected or an internal STOP A is present.

1020: Internal software error in the "Internal voltage protection" function. The "internal voltage protection" function is withdrawn. A STOP A that cannot be acknowledged is initiated.

9999: Subsequent response to fault F30611.

#### Remedy:

- select Safe Torque Off and de-select again.

- replace the Motor Module involved.

For fault value = 1020:

- carry out a POWER ON (power off/on) for all components.

- upgrade the Motor Module software.

- replace the Motor Module.

For fault value = 9999:

**Cause:**

The "Safety Integrated" function integrated in the drive in the Motor Module (MM) has detected a fault in the crosswise data comparison between the Control Unit (CU) and MM and initiated a STOP F.

As a result of this fault, after the parameterized transition has expired (p9858), fault F30600 is output (SI MM: STOP A initiated).

Fault value (r0949, interpret decimal):

0: Stop request from the Control Unit.

1 ... 999:

Number of the cross-compared data that resulted in this fault. This number is also displayed in r9895.

1: SI monitoring clock cycle (r9780, r9880).

2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.

3: SI SGE changeover tolerance time (p9650, p9850).

4: SI transition period STOP F to STOP A (p9658, p9858).

5: SI enable Safe Brake Control (p9602, p9802).

6: SI Motion enable, safety-relevant functions (p9501, internal value).

7: SI pulse suppression delay time for Safe Stop 1 (p9652, p9852).

8: SI PROFIsafe address (p9610, p9810).

9: SI debounce time for STO/SBC/SS1 (MM) (p9651, p9851).

10: SI delay time for pulse suppression for ESR (p9697, p9897).

11: SI Safe Brake Adapter mode, BICO interconnection (p9621, p9821).

12: SI Safe Brake Adapter relay ON time (p9622[0], p9822[0]).

13: SI Safe Brake Adapter relay OFF time (p9622[1], p9822[1]).

1000: Watchdog timer has expired. Within the time of approx. 5 x p9850 too many switching operations have occurred at the safety-related inputs of the Control Unit, or STO (also as subsequent response) was initiated too frequently via PROFIsafe/TM54F.

1001, 1002: Initialization error, change timer / check timer.

1950: Module temperature outside the permissible temperature range.

1951: Module temperature not plausible.

2000: Status of the STO selection on the Control Unit and Motor Module are different.

2001: Feedback signal for safe pulse suppression on the Control Unit and Motor Module are different.

2002: Status of the delay timer SS1 on the Control Unit and Motor Module are different.

6000 ... 6999:

Error in the PROFIsafe control.

For these fault values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

**Remedy:**

Re fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the wiring of the safety-relevant inputs (SGE) on the Control Unit (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller. - check the wiring of the failsafe inputs at the TM54F (contact problems).

Re fault value = 1001, 1002:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

Re fault value = 2000, 2001, 2002:

- check the tolerance time SGE changeover and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the cause of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.

Note:

The following causes may apply to fault values:

- motor cable is not shielded correctly.
- defect in control circuit of the Motor Module.
- check parameter p1278 (for SBC, only p1278 = 0 is permissible).
- select Safe Torque Off and de-select again.
- check the motor holding brake connection.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:** For the higher-level control, the following applies:

- check the PROFIsafe address in the higher-level control and Motor Modules and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

For TM54F, carry out the following steps:

**Cause:** The actual checksum calculated by the Motor Module and entered in r9398 over the safety-relevant parameters does not match the reference checksum saved in p9399 at the last machine acceptance.  
 Safety-relevant parameters have been changed or a fault is present.

**Note:**  
 This fault results in a STOP A that can be acknowledged.  
 Fault value (r0949, interpret decimal):  
 0: Checksum error for SI parameters for motion monitoring.  
 1: Checksum error for SI parameters for component assignment.

**Remedy:**  
 - check the safety-relevant parameters and if required, correct.  
 - set the reference checksum to the actual checksum.  
 - perform a POWER ON if safety parameters requiring a POWER ON have been modified.  
 - carry out an acceptance test.

#### **C30711 SI Motion MM: Defect in a monitoring channel**

**Message value:** %1

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.  
If at least one monitoring function is active, then after the parameterized timer has expired, the message C30701 "SI Motion: STOP B initiated" is output. The message is output with message value 1031 when the Sensor Module hardware is replaced.

The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- differently parameterized cycle times (p9500/p9300, p9511/p9311).
- differently parameterized axis types (p9502/p9302).
- excessively fast cycle times (p9500/p9300, p9511/p9311).
- incorrect synchronization.

Message value (r9749, interpret decimal):

0 ... 999: Number of the cross-compared data that resulted in this message. Refer to safety message C01711 for a description of the individual data.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.

1001: Initialization error of watchdog timer.

1005: Pulses already suppressed for test stop selection.

1011: Acceptance test status between the monitoring channels differ.

1012: Plausibility violation of the actual value from the encoder.

1020: Cyc. communication failure between the monit. cycles.

1021: Cyc. communication failure between the monit. channel and Sensor Module.

1023: Error in the effectiveness test in the DRIVE-CLiQ encoder

1030: Encoder fault detected from another monitoring channel.

1031: Data transfer error between the monitoring channel and the Sensor Module (p9526/p9326).

1040: Pulses suppressed with active encoderless monitoring functions.

1041: Current absolute value too low (encoderless)

1042: Current/voltage plausibility error

1043: Too many acceleration phases

1044: Actual current values plausibility error.

5000 ... 5140:

PROFIsafe message values.

For these fault values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these fault values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

See also: p9555 (SI Motion transition time STOP F to STOP B (processor 1)), r9725 (SI Motion diagnostics STOP F)

**Remedy:**

Re message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

Re message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

Re message value = 1040:

- de-select encoderless monitoring functions, select and de-select STO.
- if monitoring function is active, issue "SLS" pulse enable within 5 s of de-selecting STO.

Re other message values:

- The significance of the individual message values is described in safety message C01711 of the Control Unit.

**C30770****SI Motion MM: Discrepancy error affecting the fail-safe inputs/outputs**

**Message value:** %1  
**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The fail-safe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002 / p10102.  
 Fault value (r0949, interpret hexadecimal):  
 yyyyxxxx hex  
 xxxx: Discrepancy error for fail-safe digital inputs (F-DI).  
 Bit 0: Discrepancy error for F-DI 0  
 Bit 1: Discrepancy error for F-DI 1  
 ...  
 yyyy: Discrepancy error for fail-safe digital outputs (F-DO).  
 Bit 0: Discrepancy error for F-DO 0  
 ...  
 Note:  
 If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs.

**Remedy:**

- check the wiring of the F-DI (contact problems).

Note:  
This message can be acknowledged via F-DI or PROFIsafe.  
Discrepancy errors of an F-DI can only be completely acknowledged if safe acknowledgement was carried out once the cause of the error was resolved (p10006 or acknowledgment via PROFIsafe). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state internally.  
For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.

If the period of a cyclic switching pulse has the order of magnitude of double the value of p10002, then the following formulas must be checked.

$p10002 < (tp / 2) - td$  (discrepancy time must be less than half the period minus the actual discrepancy time)

$p10002 \geq p9500$  (discrepancy time must be no less than P9500)

$p10002 > td$  (discrepancy time must be greater than the switch discrepancy time which may actually apply)

td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI sampling cycle (see p9500).

tp = period for a switching operation in ms.

When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.

If the period of a cyclic switching pulse has the order of magnitude of twice the debounce time, then the following formulas should be checked.

$p10002 < p10017 + 1 \text{ ms} - td$

$p10002 > td$

$p10002 \geq p9500$

Example:

For a 12 ms SI sampling cycle and a switching frequency of 110 ms ( $p10017 = 0$ ), the maximum discrepancy time which can be set is as follows:

$$p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$$

Rounded-off,  $p10002 \leq 36 \text{ ms}$  is obtained (since the discrepancy time can only be accepted as a whole SI sampling cycle, the value will need to be rounded up or down to a whole SI sampling time value if the result is not an exact multiple of an SI sampling cycle).

**F30773 SI Motion MM: Test stop fault Motor Module**

**Message value:** %1  
**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** A fault has occurred on the MM side during the test stop for the fail-safe outputs.  
 Fault value (r0949, interpret hexadecimal):  
 RRRVWXYZ hex:  
 R: Reserved.  
 V: Actual state of the DO channel concerned (see X) on the CU (corresponds to the states read back from the hardware, bit 0 = DO 0, bit 1 = DO 1, etc.).  
 W: Required state of the DO channel concerned (see X, bit 0 = DO 0, bit 1 = DO 1, etc.).  
 X: DO channels involved, which indicate an error (bit 0 = DO 0, bit 1 = DO 1, etc.).  
 Y: Reason for the test stop fault.  
 Z: State of the test stop in which the fault has occurred.

Y: Reason for the test stop fault  
 Y = 1: MM side in incorrect test stop state (internal fault).  
 Y = 2: Expected states of the DOs were not fulfilled (CU305: readback via DI 22 / CU240 readback DI 2).  
 Y = 3: Incorrect timer state on CU side (internal fault)  
 Y = 4: Expected states of the diag DOs were not fulfilled (CU305: internal readback on MM channel).  
 Y = 5: Expected states of the second diag DOs were not fulfilled (CU305: internal readback on CU channel).  
 X and V indicate the DI or Diag-DO state dependent upon the reason for the fault (2, 4 or 5).  
 In the event of multiple test stop faults, the first one that occurred is shown.

Z: Test stop state and associated test actions  
 Z = 0 ... 3: Synchronization phase of test stop between CU and Motor Module no switching operations  
 Z = 4: DO + OFF and DO - OFF  
 Z = 5: Check to see if states are as expected  
 Z = 6: DO + ON and DO - ON  
 Z = 7: Check to see if states are as expected  
 Z = 8: DO + OFF and DO - ON  
 Z = 9: Check to see if states are as expected  
 Z = 10: DO + ON and DO - OFF

Z = 11: Check to see if states are as expected

7: -/0/0/-

9: -/0/1/-

11: -/0/1/-

13: -/1/1/-

Example:

Fault F01773 (CU) is signaled with fault value = 0001\_0127 and fault F30773 (MM) is signaled with fault value 0000\_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001\_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000\_0127 on the MM indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on the other channel (CU).

**Remedy:**

Check the wiring of the F-DOs and restart the test stop.

Note:

The fault is withdrawn if the test stop is successfully completed.

In the event of multiple test stop faults, the first one that occurred is shown.

Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

**Reaction:** ENCODER (IASC/DCBRAKE, OFF1, OFF2, OFF3, STOP1, STOP2)  
**Acknowledge:** PULSE INHIBIT  
**Cause:** The measured zero mark distance does not correspond to the parameterized zero mark distance.  
For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.  
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).  
Fault value (r0949, interpret decimal):  
Last measured zero mark distance in increments (4 increments = 1 encoder pulse).  
The sign designates the direction of motion when detecting the zero mark distance.

**Remedy:**  
- check that the encoder cables are routed in compliance with EMC.  
- check the plug connections.  
- check the encoder type (encoder with equidistant zero marks).  
- adapt the parameter for the distance between zero marks (p0424, p0425).

**Message value:** R track: %1

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** ENCODER (IASC/DCBRAKE, NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:**

The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 1. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign)

The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.

The response threshold for the differential signal level of the encoder is < -1600 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.

The fault value can only be represented between -32767 ... 32767 dec (-770 ... 770 mV).

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).

- Monitoring active (p0437.31 = 1).

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections and contacts of the encoder cable.
- check whether the zero mark is connected and the signal cables RP and RN have been connected correctly.
- replace the encoder cable.
- if the coding disk is soiled or the lighting aged, replace the encoder.

**Reaction:** ENCODER (IASC/DCBRAKE, NONE)  
**Acknowledge:** PULSE INHIBIT  
**Cause:** The amplitude (root of  $A^2 + B^2$ ) for encoder 1 exceeds the permissible tolerance.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response thresholds are < 1070 mV and > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** ENCODER (IASC/DCBRAKE, NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** The amplitude of the rectified encoder signals A and B and the amplitude from the roots of  $A^2 + B^2$  for encoder 1 are not within the tolerance bandwidth.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response thresholds are < 176 mV (observe the frequency response of the encoder) and > 955 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.

- check the plug connections.

- replace the encoder or encoder cable.

- check the Sensor Module (e.g. contacts).

**Message value:** Fault cause: %1 bin

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** ENCODER (IASC/DCBRAKE, NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** The unipolar level (AP/AN or BP/BN) for encoder 1 is outside the permissible tolerance.

Fault value (r0949, interpret binary):

Bit 0 = 1: Either AP or AN outside the tolerance.

Bit 16 = 1: Either BP or BN outside the tolerance.

The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV.

The response thresholds are < 1700 mV and > 3300 mV.

Note:

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).

- Monitoring active (p0437.31 = 1).

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:** - make sure that the encoder cables and shielding are installed in an EMC-compliant manner.

- check the plug connections and contacts of the encoder cable.

- check the short-circuit of a signal cable with mass or the operating voltage.

- replace the encoder cable.

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is > 750 mV. This fault also occurs if the A/D converter is overcontrolled.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Message value:** %1

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The measured zero mark distance does not correspond to the parameterized zero mark distance.

For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.

The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).

Alarm value (r2124, interpret decimal):

Last measured zero mark distance in increments (4 increments = 1 encoder pulse).

The sign designates the direction of motion when detecting the zero mark distance.

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.

- check the plug connections.

- check the encoder type (encoder with equidistant zero marks).

- adapt the parameter for the distance between zero marks (p0424, p0425).

- replace the encoder or encoder cable.

<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
<b>Remedy:</b>	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

<b>Cause:</b>	When powered down, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. <b>A31811 (F, N)</b>	<b>Encoder 1: Encoder serial number changed</b>
<b>Message value:</b>	-
<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).

Cause 1:

- The encoder was replaced.

Cause 2:

- A third-party, built-in or linear motor was re-commissioned.

Cause 3:

- The motor with integrated and adjusted encoder was replaced.

Cause 4:

- The firmware was updated to a version that checks the encoder serial number.

Note:

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).

When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

- parameterize F07414 as message type N (p2100, p2101).

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

Re causes 1, 2:

Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.

SERVO:

If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.

or

Set the adjustment via p0431. In this case, the new serial number is automatically accepted.

or

Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

Re causes 3, 4:

Accept the new serial number with p0440 = 1.

<b>F32100 (N, A)</b>	<b>Encoder 2: Zero mark distance error</b>
<b>Message value:</b>	%1
<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	OFF1 (IASC/DCBRAKE, NONE, OFF2, OFF3, STOP1, STOP2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check that the encoder cables are routed in compliance with EMC.</li><li>- check the plug connections.</li><li>- check the encoder type (encoder with equidistant zero marks).</li><li>- adapt the parameter for the distance between zero marks (p0424, p0425).</li><li>- if message output above speed threshold, reduce filter time if necessary (p0438).</li><li>- replace the encoder or encoder cable.</li></ul>

<b>Cause:</b>	The 1.5 x parameterized zero mark distance was exceeded. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). <b>F32103 (N, A)</b>	<b>Encoder 2: Amplitude error track R</b>
<b>Message value:</b>	R track: %1
<b>Drive object:</b>	SERVO_S110-CAN, SERVO_S110-DP, SERVO_S110-PN
<b>Reaction:</b>	OFF1 (IASC/DCBRAKE, NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 2. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign)

The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.

The response threshold for the differential signal level of the encoder is < -1600 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.

The fault value can only be represented between -32767 ... 32767 dec (-770 ... 770 mV).

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).

- Monitoring active (p0437.31 = 1).

**Remedy:**

- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range

- check that the encoder cables and shielding are routed in compliance with EMC.

- check the plug connections and contacts of the encoder cable.

- check whether the zero mark is connected and the signal cables RP and RN have been connected correctly.

- replace the encoder cable.

- if the coding disk is soiled or the lighting aged, replace the encoder.

yyyyxxxx hex:  
yyyy = Signal level, track B (16 bits with sign).  
xxxx = Signal level, track A (16 bits with sign).  
The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV  $-25/+20$  %).  
The response thresholds are  $< 230$  mV (observe the frequency response of the encoder) and  $> 750$  mV.  
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.  
Note for Sensor Modules for resolvers (e.g. SMC10):  
The nominal signal level is at 2900 mV (2.0 Vrms). The response thresholds are  $< 1070$  mV and  $> 3582$  mV.  
A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.  
Note:  
The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).

The following applies to measuring systems without their own bearing system:

- adjust the scanning head and check the bearing system of the measuring wheel.

The following applies for measuring systems with their own bearing system:

- ensure that the encoder housing is not subject to any axial force.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

One period of track C/D corresponds to 360 ° mechanical.

One period of the Hall signal corresponds to 360 ° electrical.

The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.

## 4 Faults and alarms

### 4.2 List of faults and alarms

After the fine synchronization using one reference mark or 2 reference marks for distance-coded encoders, this fault is no longer initiated, but instead, Alarm A32429.

Fault value (r0949, interpret decimal):

For track C/D, the following applies:

Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °).

For Hall signals, the following applies:

Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1 °).

#### Remedy:

- track C or D not connected.
- correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
- check that the encoder cables are routed in compliance with EMC.
- check the adjustment of the Hall sensor.

**Reaction:** OFF1 (IASC/DCBRAKE, NONE, OFF2, OFF3, STOP1, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out.

When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of +/-18 ° mechanical.

When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of +/-60 ° electrical.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex

yyyy: Determined mechanical zero mark position (can only be used for track C/D).

xxxx: Deviation of the zero mark from the expected position as electrical angle.

Scaling: 32768 dec = 180 °

#### Remedy:

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- if the Hall sensor is used as an equivalent for track C/D, check the connection.
- Check the connection of track C or D.

**Message value:** %1

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN

**Reaction:** OFF1 (IASC/DCBRAKE, NONE, OFF2, OFF3, STOP1, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** Absolute encoder:

When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected.

Limit value for the deviation:

- EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants).
- other encoders: 15 pulses = 60 quadrants.

Incremental encoder:

When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- The first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Fault value (r0949, interpret decimal):

Deviation in quadrants (1 pulse = 4 quadrants).

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check whether the coding disk is dirty or there are strong ambient magnetic fields.
- adapt the parameter for the clearance between zero marks (p0425).
- if message output above speed threshold, reduce filter time if necessary (p0438).

**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The measured zero mark distance does not correspond to the parameterized zero mark distance.  
For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.  
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).  
Alarm value (r2124, interpret decimal):  
Last measured zero mark distance in increments (4 increments = 1 encoder pulse).  
The sign designates the direction of motion when detecting the zero mark distance.

**Remedy:**

- check the plug connections.
- check the encoder type (encoder with equidistant zero marks).
- adapt the parameter for the distance between zero marks (p0424, p0425).

The response threshold is < 300 mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is at the negative zero crossover of track B.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

The position value has exceeded the permissible range of -0.5 ... +0.5.

Alarm value (r2124, interpret decimal):

1: Position value from the LVDT sensor.

2: Position value from the encoder characteristic.

**Remedy:** Re alarm value = 1:  
 - Check the LVDT ratio (p4678).  
 - check the reference signal connection at track B.  
 Re alarm value = 2:

**Message value:** -  
**Drive object:** SERVO\_S110-CAN, SERVO\_S110-DP, SERVO\_S110-PN  
**Reaction:** OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).  
**Remedy:** The fault should be resolved as follows:  
 - select encoder commissioning (p0010 = 4).  
 - reset the position tracking as follows (p0411.2 = 1).  
 - de-select encoder commissioning (p0010 = 0).  
 The fault should then be acknowledged and the absolute encoder adjusted.

**Reaction:** OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** When powered down, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Fault value (r0949, interpret decimal):  
 Deviation (difference) to the last encoder position in increments of the absolute value.  
 The sign designates the traversing direction.  
**Note:**  
 The deviation (difference) found is also displayed in r0477.

**Cause:** When the run-time groups of the free function blocks attempted to log on with the sampling time management, the logon of at least one run-time group was rejected.  
Too many different hardware sampling times may have been assigned to the free function blocks.  
See also: r20008 (Hardware sampling times available)

**Remedy:** - check number of different hardware sampling times (r20008, r7903).  
- if necessary, deactivate again the drive object on which the function module "free function blocks" was last activated (p0108[0...15].18 = 0). Then carry out a POWER ON.  
**Note:**  
The assignment of drive object numbers to the index numbers of p0108[0...15] can be read out in p0101[0...15]; the assignment to the drive object types can be read out in p0107[0...15] on the drive object of the CU or CX (only with SM150).

#### **A50514 FBLOCKS: Sampling time of fixed run-time group differs**

**Message value:** -  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The sampling time of a system function was set to a value (p0112, p0115) lower than the smallest permissible sampling time that is allowed for the fixed run-time group belonging to this system block (1 ms). The fixed run-time group involved is assigned as a minimum to one block.  
**Remedy:** Using p0112 or p0115, increase the sampling time of the system function to the minimum permissible sampling time for the run-time groups of 1 ms or change the sampling time assignment of this run-time group in p20000[0...9].

#### **F50518 FBLOCKS: Sampling time of free run-time group differs at download**

**Message value:** %1  
**Drive object:** All objects  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** In the STARTER/SCOUT project that was downloaded, the hardware sampling time of a free run-time group ( $1 \leq p20000[i] \leq 256$ ) was set to a value that was either too low or too high.  
The sampling time must be between 1 ms and the value r20003 - r20002.  
If the sampling time of the selected free run-time group is  $< 1$  ms, the equivalent value of 1 ms is used.  
If the value  $\geq r20003$ , then the sampling time is set to the next higher or the same software sampling time  $\geq r21003$ .  
Fault value (r0949, interpret decimal):  
Number of the p20000 index of the run-time group where the sampling time is incorrectly set.  
Number of the run-time group = fault value + 1  
Note:  
For SIMOTION D410, r20003 (unlike all the other Control Units) is automatically set the same as the PROFIBUS sampling time.  
See also: r20008 (Hardware sampling times available)  
**Remedy:** - correctly set the sampling time of the run-time group.  
- if required, take all of the blocks from the run-time group.  
Note:  
Fault F50518 only detects an incorrectly parameterized run-time group. If, after correcting p20000[i] in the project, this error occurs again at download, then the run-time group involved should be identified using the fault value (r0949) and the sampling time correctly set.

## A.3 List of abbreviations

### Note

The following list of abbreviations includes all abbreviations and their meanings used in the entire SINAMICS family of drives.

Abbreviation	Source of abbreviation	Meaning
<b>A</b>		
A...	Alarm	Alarm
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog-digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced Operator Panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short-Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American standard code for information interchange
AS-i	AS-Interface (Actuator Sensor Interface)	AS-interface (open bus system in automation technology)
ASM	Asynchronmotor	Induction motor
<b>B</b>		
BB	Betriebsbedingung	Operating condition
BERO	-	Proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	BG-Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output
BOP	Basic Operator Panel	Basic Operator Panel
<b>C</b>		
C	Capacitance	Capacitance
C...	-	Safety message
CAN	Controller Area Network	Serial bus system
CBC	Communication Board CAN	Communication Board CAN
CBE	Communication Board Ethernet	Communication Board PROFINET (Ethernet)
CD	Compact Disk	Compact disk
CDS	Command Data Set	Command data set
CF card	CompactFlash card	CompactFlash card
CI	Connector Input	Connector input

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Meaning</b>
CLC	Clearance Control	Clearance control
CNC	Computer Numerical Control	Computer-supported numerical control
CO	Connector Output	Connector output
CO/BO	Connector Output / Binector Output	Connector/binector output
COB ID	CAN Object Identification	CAN object identification
CoL	Certificate of License	Certificate of License
COM	Common contact of a changeover relay	Center contact on a changeover contact
COMM	Commissioning	Commissioning
CP	Communications Processor	Communications processor
CPU	Central Processing Unit	Central processing unit
CRC	Cyclic Redundancy Check	Cyclic redundancy check
CSM	Control Supply Module	Control Supply Module
CU	Control Unit	Control Unit
CUA	Control Unit Adapter	Control Unit Adapter
CUD	Control Unit DC MASTER	Control Unit DC MASTER
<b>D</b>		
DAC	Digital Analog Converter	Digital-analog converter
DC	Direct Current	Direct current
DCB	Drive Control Block	Drive Control Block
DCBRK	DC Brake	DC braking
DCC	Drive Control Chart	Drive Control Chart
DCN	Direct Current Negative	Direct current negative
DCP	Direct Current Positive	Direct current positive
DDS	Drive Data Set	Drive data set
DI	Digital Input	Digital input
DI/DO	Digital Input / Digital Output	Bidirectional digital input/output
DMC	DRIVE-CLiQ Hub Module Cabinet	DRIVE-CLiQ Hub Module Cabinet
DME	DRIVE-CLiQ Hub Module External	DRIVE-CLiQ Hub Module External
DMM	Double Motor Module	Double Motor Module
DO	Digital Output	Digital output
DO	Drive Object	Drive object
DP	Decentralized Peripherals	Distributed peripherals
DPRAM	Dual Ported Random Access Memory	Dual-port random access memory
DQ	DRIVE-CLiQ	DRIVE-CLiQ
DRAM	Dynamic Random Access Memory	Dynamic random access memory
DRIVE-CLiQ	Drive Component Link with IQ	Drive Component Link with IQ
DSC	Dynamic Servo Control	Dynamic Servo Control
DTC	Digital Time Clock	Timer
<b>E</b>		
EASC	External Armature Short-Circuit	External armature short-circuit
EDS	Encoder data set	Encoder data set
EEPROM	Electrically Erasable Programmable Read-Only Memory	Electrically Erasable Programmable Read-Only-Memory

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Meaning</b>
EGB	Elektrostatisch gefährdete Baugruppen	Electrostatic sensitive devices
ELCB	Earth Leakage Circuit-Breaker	Residual current operated circuit breaker
ELP	Earth Leakage Protection	Ground-fault monitoring
EMC	Electromagnetic Compatibility	Electromagnetic compatibility
EMF	Electromotive Force	Electromotive force
EMK	Elektromotorische Kraft	Electromotive force
EMV	Elektromagnetische Verträglichkeit	Electromagnetic compatibility
EN	Europäische Norm	European standard
EnDat	Encoder-Data-Interface	Encoder interface
EP	Enable Pulses	Enable pulses
EPOS	Einfachpositionierer	Basic positioner
ES	Engineering System	Engineering system
ESB	Ersatzschaltbild	Equivalent circuit diagram
ESD	Electrostatic Sensitive Devices	Electrostatic sensitive devices
ESM	Essential Service Mode	Essential service mode
ESR	Extended Stop and Retract	Extended stop and retract
<b>F</b>		
F...	Fault	Fault
FAQ	Frequently Asked Questions	Frequently asked questions
FBLOCKS	Free Blocks	Free function blocks
FCC	Function Control Chart	Function control chart
FCC	Flux Current Control	Flux current control
FD	Function Diagram	Function diagram
F-DI	Fail-safe Digital Input	Fail-safe digital input
F-DO	Fail-safe Digital Output	Fail-safe digital output
FEM	Fremderregter Synchronmotor	Separately excited synchronous motor
FEPRM	Flash EPROM	Non-volatile write and read memory
FG	Function Generator	Function generator
FI	-	Residual current
FOC	Fiber-Optic Cable	Fiber-optic cable
FP	Funktionsplan	Function diagram
FPGA	Field Programmable Gate Array	Field programmable gate array
FW	Firmware	Firmware
<b>G</b>		
GB	Gigabyte	Gigabyte
GC	Global Control	Global control telegram (broadcast telegram)
GND	Ground	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as M)
GSD	Generic Station Description	Generic Station Description: Describes the features of a PROFIBUS slave
GSV	Gate Supply Voltage	Gate supply voltage
GUID	Globally Unique Identifier	Globally unique identifier

Abbreviation	Source of abbreviation	Meaning
<b>H</b>		
HF	High Frequency	High frequency
HFD	Hochfrequenzdrossel	High-frequency reactor
HLA	Hydraulic Linear Actuator	Hydraulic linear drive
HLG	Hochlaufgeber	Ramp-function generator
HM	Hydraulic Module	Hydraulic Module
HMI	Human Machine Interface	Human machine interface
HTL	High-Threshold Logic	Logic with high fault threshold
HW	Hardware	Hardware
<b>I</b>		
i. V.	In Vorbereitung	Under development: This property is currently not available
I/O	Input/Output	Input/output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Commissioning
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Bipolar transistor with insulated control electrode
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor power switch with integrated control electrode
IL	Impulslöschung	Pulse suppression
IP	Internet Protocol	Internet protocol
IPO	Interpolator	Interpolator
IT	Isolé Terre	Non-grounded three-phase line supply
IVP	Internal Voltage Protection	Internal voltage protection
<b>J</b>		
JOG	Jogging	Jogging
<b>K</b>		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-How Protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY	-	Special temperature sensor
<b>L</b>		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light-emitting diode
LIN	Linear motor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least significant bit
LSC	Line-Side Converter	Line-side converter

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Meaning</b>
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cables
<b>M</b>		
M	-	Symbol for torque
M	Mass	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product code
MM	Motor Module	Motor Module
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor-Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (class 1) and slave
MSR	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
<b>N</b>		
N. C.	Not Connected	Not connected
N...	No Report	No report or internal message
NAMUR	Normenarbeitsgemeinschaft für Mess- und Regeltechnik in der chemischen Industrie	Standardization association for measurement and control in chemical industries
NC	Normally Closed (contact)	NC contact
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization body in the US
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contact
NSR	Netzstromrichter	Line-side converter
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory
<b>O</b>		
OA	Open Architecture	Software component (technology package) which provides additional functions for the SINAMICS drive system
OAIF	Open Architecture Interface	Version of the SINAMICS firmware from which the OA-application can be used
OASP	Open Architecture Support Package	Expands the STARTER commissioning tool by the corresponding OA-application
OC	Operating Condition	Operating condition
OEM	Original Equipment Manufacturer	Original equipment manufacturer

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Meaning</b>
OLP	Optical Link Plug	Bus connector for fiber-optic cable
OMI	Option Module Interface	Option Module Interface
<b>P</b>		
p...	-	Setting parameters
P1	Processor 1	CPU 1
P2	Processor 2	CPU 2
PB	PROFIBUS	PROFIBUS
PcCtrl	PC Control	Master control
PD	PROFIdrive	PROFIdrive
PDS	Power unit Data Set	Power unit data set
PE	Protective Earth	Protective ground
PELV	Protective Extra-Low Voltage	Safety extra-low voltage
PEM	Permanenterregter Synchronmotor	Permanent-magnet synchronous motor
PG	Programmiergerät	Programming device
PI	Proportional Integral	Proportional integral
PID	Proportional Integral Differential	Proportional integral differential
PLC	Programmable Logic Controller	Programmable logic controller
PLL	Phase-Locked Loop	Phase-locked loop
PM	Power Module	Power Module
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point-to-Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point-To-Point	Point-to-point
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
<b>Q</b>		
<b>R</b>		
r ...	-	Display parameters (read only)
RAM	Random Access Memory	Read/write memory
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
RFG	Ramp-Function Generator	Ramp-function generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RLM	Renewable Line Module	Renewable Line Module

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Meaning</b>
RO	Read Only	Read only
ROM	Read-Only Memory	Read-only memory
RPDO	Receive Process Data Object	Receive process data object
RS 232	Recommended Standard 232	Interface standard for cable-connected serial data transmission between a sender and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of senders and receivers, also known as EIA485)
RTC	Real-Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space vector approximation
<b>S</b>		
S1	-	Continuous duty
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SD Card	SecureDigital Card	Secure digital memory card
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switches
SG	Sicher reduzierte Geschwindigkeit	Safely-limited speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe standstill
SI	Safety Integrated	Safety Integrated
SIL	Safety Integrity Level	Safety integrity level
SLM	Smart Line Module	Smart Line Module
SLP	Safely-Limited Position	Safely limited position
SLS	Safely-Limited Speed	Safely-limited speed
SLVC	Sensorless Vector Control	Vector control without encoder
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SMI	Sensor Module Integrated	SINAMICS Sensor Module Integrated
SMM	Single Motor Module	Single Motor Module
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SP	Safe Position	Safe position
SPC	Setpoint Channel	Setpoint channel

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Meaning</b>
SPI	Serial Peripheral Interface	Serial peripheral interface
SPS	Speicherprogrammierbare Steuerung	Programmable Logic Controller
SS1	Safe Stop 1	Safe stop 1 (monitored for time and ramp)
SS2	Safe Stop 2	Safe stop 2
SSI	Synchronous Serial Interface	Synchronous serial interface
SSM	Safe Speed Monitor	Safe feedback from speed monitor
SSP	SINAMICS Support Package	SINAMICS support package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
<b>T</b>		
TB	Terminal Board	Terminal Board
TIA	Totally Integrated Automation	Totally Integrated Automation
TM	Terminal Module	Terminal Module
TN	Terre Neutre	Grounded three-phase line supply
Tn	-	Integral-action time
TPDO	Transmit Process Data Object	Transmit process data object
TT	Terre Terre	Grounded three-phase line supply
TTL	Transistor-Transistor Logic	Transistor-transistor logic
Tv	-	Derivative action time
<b>U</b>		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal time coordinated
<b>V</b>		
VC	Vector Control	Vector control
Vdc	-	DC-link voltage
VdcN	-	Partial DC-link voltage, negative
VdcP	-	Partial DC-link voltage, positive
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VPM	Voltage Protection Module	Voltage Protection Module
Vpp	Volt peak to peak	Volt peak-to-peak
VSM	Voltage Sensing Module	Voltage Sensing Module
<b>W</b>		
WEA	Wiedereinschaltautomatik	Automatic restart
WZM	Werkzeugmaschine	Machine tool
<b>X</b>		
XML	Extensible Markup Language	Extensible Markup Language (standard language for Web publishing and document management)

<b>Abbreviation</b>	<b>Source of abbreviation</b>	<b>Meaning</b>
<b>Y</b>		
<b>Z</b>		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
SW	Zustandswort	Status word
