Description: Configuration settings for know-how protection.

For bit 00, 01:

When KHP is activated, this means that the OEM can define whether the parameters and DCC data encrypted on the memory card should be protected before using on other memory cards/Control Units.

For bit 02:

This means that the OEM can define whether it is possible or not to trace the drive data using the device trace function although KHP is activated.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Extended copy protection - linked to the memory card and CU	Yes	No	-
	01	Basic copy protection - linked to the memory card	Yes	No	-
	02	Permit trace and measuring functions for diagnostic purposes	Yes	No	-

Dependency: Refer to: p7766, p7767, p7768

Note: KHP: Know-How Protection

For copy protection, the serial numbers of the memory card and/or Control Unit are checked.

The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated.

For bit 00, 01:

If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies.

There is no copy protection if both bits are set to 0.

Dependency:	Refer to: p7767, p7768		
Notice:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. When using the STARTER commissioning software, the password should be entered using the associated dialogs. The following rules apply when entering the password: - password entry must start with p7766[0]. - no gaps are permissible in the password. - entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).		
Note:	KHP: Know-How Protection When reading, p7766[0...29] = 42 dec (ASCII character = "***") is displayed. Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection. Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated. Dependency:	Refer to: p7765, p7766, p7767, p7768		
Note:	KHP: Know-How Protection - the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data". - SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

Description:	Sets the action to be executed for NVRAM data. At the end of the action the value is automatically set to 0.		
Value:	0: Inactive 1: Load NVRAM data to parameters 2: Load parameters to NVRAM 3: Reset		
Notice:	After action p7770 = 1 no more pulses may be enabled. After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.		
Note:	If value = 1: This action loads the NVRAM data to the parameters. If value = 2: This action loads the parameters to the NVRAM. If value = 3: This action sets parameters p7771 ... p7774 to the factory setting. It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.		

p7775	NVRAM data backup/import/delete / NVRAM backup		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: C1, U, T Data type: Integer16 P-Group: All groups Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 17	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0

Notice:	For value = 2, 3: These actions are only possible when pulses are inhibited.		
Note:	After the action has been successfully completed, the parameter is automatically set to zero. The actions importing and deleting NVRAM data immediately initiate a warm restart. If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

If "No signal" is set for a trace channel, then the recording duration of the other time characteristics is increased. For index 8 ... 15: The signals are set in p7790[8...15], whose instantaneous value is to be recorded.		
Value:	0: No signal 1: Pulse frequency 2: Phase current U 3: Phase current V

Note: In the operation state, when a trigger event occurs, the trace data of the signals are saved in the component. The oldest trace data are overwritten after more than 5 trigger events.
The trigger event can be set in p7791.
By activating p7792, the trace data of the component is written to files on the non-volatile storage medium (memory card). Experts can then evaluate this data.

Description: Setting to upload and save the trace data of the component trace.

Experts can then evaluate this data.

For p7792 = 1, the trace data of the component is written to files on the memory card in a non-volatile fashion.
The parameter is then automatically set to zero.

Description: Displays the version of the firmware stored on the memory medium of the drive device.
Depending on the drive device being used, the memory medium is a memory card, or an internal non-volatile device memory.

Index: [0] = Internal
[1] = External
[2] = Parameter backup

2 Parameters

2.2 List of parameters

Note: For index 0:
Displays the internal firmware version (e.g. 04402315).
This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions.
For index 1:
Displays the external firmware version (e.g. 04040000 -> 4.4).
For automation systems with SINAMICS Integrated this is the runtime version of the automation system.
For index 2:
Displays the internal firmware version of the parameter backup.
With this CU firmware version, the parameter backup was saved, which was used when powering up.

	Min	Max	Factory setting
	0	65535	0
Description:	Sets the priority for processing the existing drive objects in the system. The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check. With the factory setting the following priorities regarding processing are applicable: - the drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU_LINK - if they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.		
Index:	[0] = Drive object number Control Unit [1] = Drive object number object 1 [2] = Drive object number object 2 [3] = Drive object number object 3 [4] = Drive object number object 4 [5] = Drive object number object 5 [6] = Drive object number object 6 [7] = Drive object number object 7 [8] = Drive object number object 8 [9] = Drive object number object 9 [10] = Drive object number object 10 [11] = Drive object number object 11 [12] = Drive object number object 12 [13] = Drive object number object 13 [14] = Drive object number object 14 [15] = Drive object number object 15 [16] = Drive object number object 16 [17] = Drive object number object 17 [18] = Drive object number object 18		

[19] = Drive object number object 19
 [20] = Drive object number object 20
 [21] = Drive object number object 21
 [22] = Drive object number object 22
 [23] = Drive object number object 23

Notice: This parameter may only be used by qualified service personnel.

Note: If the same drive object numbers are used and if the existing drive object numbers in the system are entered incompletely, the content of this parameter is ignored entirely. The behavior as with factory setting will then become effective.

Description:

Display or setting of the CANopen Node ID.

The Node ID can be set as follows:

1) Using the address switch on the Control Unit.

--> p8620 can then only be read and displays the selected Node ID.

--> A change only becomes effective after a POWER ON.

--> CANopen Node ID and PROFIBUS address are identical.

- 2) Using p8620
 --> Only if address 0 is set using the address switch.
 --> the Node ID is set as standard to 126.
 --> A change only becomes effective after save and POWER ON.

Dependency:

Refer to: r8621

Note:

Every node ID change only becomes effective after a POWER ON.

The active node ID is displayed in r8621.

The parameter is not influenced by setting the factory setting.

It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (prerequisite: the address 0 is set for the address switch).

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

For bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

Sets the automatic BICO interconnection of the CANopen control word.

Value:

0: No interconn
1: Interconnection

Dependency:

Refer to: r2050, r2090, r2091, r2092, r2093, r8750, r8795, r8850, r8890, r8891, r8892, r8893

Note: The following BICO interconnections are automatically established if the CANopen control word is mapped at one of the locations $x = 0 \dots 3$ in the receive process data buffer.

For SINAMICS S120 with CBC10, the PZD interface IF2 is used:

BI: p0840.0 = r889x.0
 BI: p0844.0 = r889x.1
 BI: p0848.0 = r889x.2
 BI: p0852.0 = r889x.3
 BI: p2103.0 = r889x.7

For SINAMICS S110, the PZD interface IF1 is used:

BI: p0840.0 = r209x.0
 BI: p0844.0 = r209x.1
 BI: p0848.0 = r209x.2
 BI: p0852.0 = r209x.3
 BI: p2103.0 = r209x.7

The write access is rejected if a CANopen control word is not mapped at one of these locations.
 This also causes the project download of the commissioning software to be canceled.

Description: Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".
Generally, control world 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

Value: 0: Freeze setpoints and continue to process sign-of-life
1: Freeze setpoints and sign-of-life
2: Do not freeze setpoints

Recommendation: Do not change the setting p2037 = 0.

Note: If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

2.2 List of parameters

Note: For value = 99 (automatic) the following applies:
- if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1.
- if a CBE20 is inserted, then the following applies:
-- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2.
-- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2.
- CAN CBC10 always communicates via IF2.
For a value not equal to 99 (automatic) the following applies:
- both indices must be set to a number not equal to 99 (automatic).
A change only becomes effective after POWER ON, reset or download.

Description:	Activate a modified send configuration for COMM BOARD. With p8842 = 1, the values in p8841 are transferred to the COMM BOARD and activated. After this, p8842 is automatically set to zero.		
Dependency:	Refer to: p8841		
Note:	For CBE20, certain SINAMICS parameters are newly evaluated and activated. An existing, cyclic bus connection is interrupted.

Dependency:

Refer to: C01711

Notice:

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note:

For bit 00:

When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.

For bit 01:

When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

For bit 02:

This bit defines the type of motor, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for an induction motor.

For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.

Bit = 0 should be set if no motor is defined (p0300 = 0).

For bit 03:

When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

For bit 05:

This bit defines the type of modulation, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for space vector modulation.

For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

Description:

Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active	-
08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-

Dependency:

Refer to: C01711

Notice:

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note:

SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description:	Sets the delay time for monitoring the brake ramp. Monitoring of the brake ramp starts once the delay time has elapsed.		
Dependency:	Refer to: p9381, p9383		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The set time is rounded internally to an integer multiple of the monitoring clock cycle. Internally, the set time is limited downwards to 2 safety monitoring clock cycles (2 * p9500/p9300).

p9385	SI Motion actual value sensing sensorless fault tolerance (MM) / ActVal sl tol MM		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: Integer32 P-Group: Safety Integrated Not for motor type: - Min -1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 4	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -1
Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: p9507 Refer to: F30681, C30711		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 5.00 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [ms]
Description:	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).		
Dependency:	Refer to: C30711		
Caution:	The safety functionality is only completely guaranteed after this time has expired.		
			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The set time is rounded internally to an integer multiple of the monitoring clock cycle.		

p9387	SI Motion actual value sensing sensorless filter time (MM) / Actv sl t_filt MM		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [µs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100000.00 [µs]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 25000.00 [µs]
Description:	Sets the filter time for smoothing the actual value with sensorless actual value sensing.		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. A longer filter time results in a longer response time.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The smoothing is realized with a 1st order filter. For p9387 = minimum value, the filter is deactivated. The set time is rounded internally to an integer multiple of the monitoring clock cycle.		
p9388	SI Motion actual value sensing sensorless minimum current (MM) / ActVal sl I_min MM		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 10.00 [%]
Description:	Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA). - the value must be increased if C30711 has occurred with message value 1042. - the value must be decreased if C30711 has occurred with message value 1041. For synchronous motors, the following condition must be fulfilled: $ p0305 \times p9783 \geq p9388 \times 1.2$		
Recommendation:	If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.		
Dependency:	Refer to: r9785 Refer to: C30711		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).		
p9389	SI Motion actual value sensing sensorless accel. limit (MM) / ActVal sl a_lim MM		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 10.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3300.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [%]
Description:	Sets the acceleration limit to filter velocity fluctuations. If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur. If this value is decreased, and this dampens the velocity peaks when accelerating. - the value must be increased if C30711 with message value 1043 has occurred. - the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.		

2 Parameters

2.2 List of parameters

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.
To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: Refer to: r9784
Refer to: C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For p9389 = maximum value, the filter is deactivated.
Diagnostics parameter p9784 must be used to correctly set this parameter.

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [°]	737280 [°]	0 [°]

Description: Sets the modulo value in degrees for rotary axes of the "Safe position" function.
This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.
The value should be set, so that it is precisely at 2^n revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump.
The modulo function is deactivated for a value = 0.

Dependency: Refer to: p9501
Refer to: F01681

Notice: When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F01681 will be output.

If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

Note: SLP: Safely Limited Position
SP: Safe Position

For bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active. For bit 03: When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated. SS1E: Safe Stop 1 external (Safe Stop 1 with external stop) For bit 06: For the automatic test stop, the test stop can still be initiated via binector input p9705. Dependency:	Refer to: C01711				
Note:	For bit 00: When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.				
	For bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.				
	For bit 02: This bit defines the type of motor, which the sensorless actual value sensing evaluates.				
	For bit = 0, the actual velocity is calculated for an induction motor.				
	For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.				
	Bit = 0 should be set if no motor is defined (p0300 = 0).				
	For bit 03: When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.				
	SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)				
	For bit 05: This bit defines the type of modulation, which the sensorless actual value sensing evaluates.				
	For bit = 0, the actual velocity is calculated for space vector modulation.				
	For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.				
	For bit 06: When the bit is active, the test stop of the Extended Functions and the test stop of the onboard F-DO is carried out. The onboard F-DO can be deactivated via p10046.				
	Also for the automatic test stop, the test stop of the F-DO can be started using binector input p10007. The test stop for Extended Functions can still be started via p9705.				
	The automatic test stop is executed after power up, partial power up or a warm restart.

06	Configuration test stop motion monitoring functions	Test automatic	Test manual	-

Dependency:

Refer to: C01711

Note:

For bit 00:

When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.

For bit 01:

When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

For bit 02:

This bit defines the type of motor, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for an induction motor.

For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.

Bit = 0 should be set if no motor is defined (p0300 = 0).

For bit 03:

When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

For bit 05:

This bit defines the type of modulation, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for space vector modulation.

For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

For bit 06:

For the automatic test stop, the test stop can still be initiated via binector input p9705.

The automatic test stop is executed after power up, partial power up or a warm restart.

Description:

Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active	-
08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-

Dependency:

Refer to: C01711

Notice:

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note:

SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description:	Setting for clock cycle synchronous communication between PROFIdrive controller and Control Unit. The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 =1). If a PROFIdrive controller exchanges process data in clock cycle synchronism with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data in clock cycle synchronism. Examples for clock cycle synchronous communication: - clock-cycle synchronous control for the motion control (e.g. SIMOTION). - clock-cycle synchronous PROFIsafe master (e.g. SIMATIC S7-400F).		
Value:	0: Communication not isochronous 1: Communication isochronous

Dependency:	Refer to: p0115 Refer to: F01652		
Note:	The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1). The monitoring clock cycle from p9500 must be an integer multiple of this parameter. In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.		

The clock cycle time of the actual value sensing should not be set to more than 8 ms.

A change only becomes effective after a POWER ON.

Dependency: Refer to: p0414, r0472, p9325
Note: For safe functions that are not enabled (p9501 = 0), the following applies:
 - p9525 is automatically set the same as r0472 when the system boots.
 For safety functions that are enabled (p9501 > 0), the following applies:
 - p9525 is checked to see that it matches r0472.

Description: Sets the number of the encoder, which is used by the second channel for safe motion monitoring functions.

Dependency: For the safe motion monitoring functions, the redundant safety position actual value sensing must be activated in the appropriate encoder data set (p0430.19 = 1).

Refer to: p0187, p0188, p0189, p0430

Note: - For p9526 = 1, the encoder for the closed-loop speed control is used for the second channel of the motion monitoring functions (1-encoder system). This setting is only permissible when using a DQI encoder.
 - a change only becomes effective after a POWER ON.

Description: Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

	Min	Max	Factory setting	
	0.00 [mm/min]	1000.00 [mm/min]	0.00 [mm/min]	
Description:	Sets the switchover velocity to SOS/SLS level. Below this velocity limit, for a transition to SOS/SLS level, standstill (zero velocity) is assumed. The transition times from STOP C, D, E and the delay time when selecting SOS are canceled if this velocity threshold is fallen below. The wait time from p9569 is started, and after it has expired, SOS is active. The transition time from a higher to a lower safety-limited velocity level is canceled when this velocity level is fallen below. The wait time from p9569 is started, and after it has expired, the new SLS level becomes active. For a STOP C, this switchover velocity is the only criterion for prematurely activating an SOS. In the other cases mentioned here, it must first have been signaled that the axis had correctly braked.			
Dependency:	Refer to: p9501, p9551, p9552, p9553, p9554			
Note:	With p9567 = 0, reducing the wait time for the transition to SOS/SLS level is deactivated. SOS: Safe Operating Stop SLS: Safely Limited Speed

Description:	Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.		
Dependency:	Refer to: r9713		
Note:	The parameter is only effective when PROFIsafe telegram 901 is selected. By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor. If, during operation, a position actual value is determined, which cannot be scaled to the 16 bits, then message C0711 with value 7001 is output and safety stop response STOP F.

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: Integer32 P-Group: Safety Integrated Not for motor type: - Min -1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 4	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -1
Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: r9787 Refer to: F01681, C01711		
Notice:	Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Description:	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).		
Dependency:	Refer to: C01711		
Caution:	The safety functionality is only completely guaranteed after this time has expired.		
			
Notice:	If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The set time is rounded internally to an integer multiple of the monitoring clock cycle.		
p9587	SI Motion actual value sensing sensorless filter time (CU) / Actv sl t_filt CU		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 25.00 [ms]
Description:	Sets the filter time for smoothing the actual value with sensorless actual value sensing.		
Notice:	A longer filter time results in a longer response time.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The smoothing is realized with a 1st order filter. For p9587 = minimum value, the filter is deactivated. The set time is rounded internally to an integer multiple of the monitoring clock cycle.		
p9588	SI Motion actual value sensing sensorless minimum current (CU) / ActVal sl I_min CU		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 10.00 [%]
Description:	Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA). - the value must be increased if C01711 has occurred with message value 1042. - the value must be decreased if C01711 has occurred with message value 1041. For synchronous motors, the following condition must be fulfilled: $ p0305 \times p9783 \geq p9588 \times 1.2$		
Recommendation:	If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.		
Dependency:	Refer to: r9785 Refer to: C01711		
Notice:	If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).		

p9589	SI Motion act. value sensing sensorless acceleration limit (CU) / ActVal sl a_lim CU		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 10.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3300.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [%]
Description:	Sets the acceleration limit to filter velocity fluctuations. If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur. If this value is decreased, and this dampens the velocity peaks when accelerating. - the value must be increased if C01711 with message value 1043 has occurred. - the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.		
Recommendation:	The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration. To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.		
Dependency:	Refer to: r9784 Refer to: C01711		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For p9589 = maximum value, the filter is deactivated. Diagnostics parameter p9784 must be used to correctly set this parameter.

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0).
It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.
The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.
It is not permissible to parameterize "motor holding brake without feedback signals" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).

2.2 List of parameters

Dependency: Refer to: p9812

Note: For the set stop response STOP B, in order that the OFF3 ramp is actually maintained, when just using Safety Basic functions, the following must be carefully observed:

- the transition time STOP F to STOP A (p9658, p9858) must be set longer or equal to the SS1 delay time (p9652, p9852).
- if a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119).

Description:	Sets the transition period from STOP F to STOP A on the Control Unit.		
Dependency:	Refer to: r9795, p9858 Refer to: F01611		
Note:	For a crosswise data comparison between p9658 and p9858, a difference of one Safety monitoring clock cycle is tolerated. Description:	Displays the velocity resolution for safety-relevant motion monitoring functions. For index 0: Displays the safe velocity resolution (load side). Setpoints for velocity limits or parameter changes for velocities below this threshold have no effect. For index 1: Displays the safe velocity accuracy based on the safe encoder accuracy		
Index:	[0] = Actual velocity resolution [1] = Minimum velocity resolution		
Note:	For index 0: This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Conversion of: (internal fixed value/ Tsi) to mm/min (linear) or rpm (rotary) with Tsi = p9500 (SI Motion monitoring clock cycle). Example: For Tsi = 12 ms, r9732[0] = 5 mm/min (linear) or 1/72 rpm (rotary) is obtained. For index 1: - for a 2-encoder system with non safety-capable encoders, this means the poorer value for both encoders. Index[1] takes into account the coarse resolution of the encoder only Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result returns mm/min (linear) or rpm (rotary). - for safety without encoder, index 1 is not relevant, and is always the value of zero.

Note:	For index 0: This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Conversion of: (internal fixed value/ Tsi) to mm/min (linear) or rpm (rotary) with Tsi = p9500 (SI Motion monitoring clock cycle). Example: For Tsi = 12 ms, r9732[0] = 5 mm/min (linear) or 1/72 rpm (rotary) is obtained. For index 1: - for a 2-encoder system with non safety-capable encoders, this means the poorer value for both encoders. Index[1] takes into account the coarse resolution of the encoder only Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result returns mm/min (linear) or rpm (rotary). - for safety without encoder, index 1 is not relevant, and is always the value of zero.

HLA	Can be changed: - Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min - [m/min]	Calculated: - Dyn. index: - Unit group: 4_1 Scaling: p2000 Max - [m/min]	Access level: 3 Func. diagram: 2820, 2824, 3630 Unit selection: p0505 Expert list: 1 Factory setting - [m/min]	
Description:	Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions. Contrary to the parameterization of the SI limit values, this parameter specifies the actuator-side limit value and not the load-side limit value.			
Recommendation:	For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized. - Cl: p1051 = r9733[0] - Cl: p1052 = r9733[1] Additional limiting can also be activated using connector input p1085 and p1088.			
Index:	[0] = Setpoint limiting positive [1] = Setpoint limiting negative [2] = Setpoint limit absolute			
Dependency:	For SLS: r9733[0] = p9531[x] x p9533 (converted from the load side to the actuator side) For SDI negative: r9733[0] = 0 For SLS: r9733[1] = - p9531[x] x p9533 (converted from the load side to the actuator side) For SDI positive: r9733[1] = 0 [x] = Selected SLS stage			

Conversion factor from the actuator side to the load side:

- actuator = rotary and axis type = linear: $p9522 / (p9521 \times p9520)$

- otherwise: $p9522 / p9521$

Refer to: p9531, p9533

Notice: If p1051 = r9733[0] is interconnected, p1052 = r9733[1] must also be interconnected and vice versa.

If only the absolute value of the setpoint velocity limiting is required, r9733[2] must be interconnected.

Note: If the "SLS" or "SDI" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082.

The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9719/r9720 and r9721/r9722.

Dependency:

Note:

For bit 00:

When STO or "Safe power inhibit" is selected, the cause is displayed in bits 16 ... 21.

For bit 01:

- For p9772.1 = 1 and p9772.19 = 0, an STO from the Safety Basic functions is active.

- For p9772.1 = 1 and p9772.19 = 1, safe power inhibit is active, if safety functions without selection are activated via p9601.2/p9801.2 = 1 and p9601.5/p9801.5 = 1.

Note:

If p9601.0 = 1 and p9601.2 = 1 and p9801.5 = 1 then for bit 0 and 1, the STO function applies.

For bit 05:

When SS1 is selected, the cause is displayed in bits 22 and 23.

For bit 18:

When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).

For bit 19:

With SMM with encoder no actual value sensing is possible on account of parking.

For Safety functions without selection, safe power inhibit to selected (p9772.19 = 1).

SMM: Safe Motion Monitoring

For bit 22 and 23:

These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time.

If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

Description:	Sets the additional field-generating current for synchronous motors with sensorless actual value sensing. The set value is referred to p0305. This parameter ensures a "base load" for the motor. The value must fulfill the following condition: $ p0305 \times p9783 \geq p9588 \times 1.2$		
Dependency:	Refer to: p9588 Refer to: C01711		
Notice:	Reducing this percentage value can adversely affect actual value sensing with synchronous motors. If the value is increased, this results in an increased motor power loss.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For p9783 = maximum value, current injection is deactivated. Current injection is not effective in the U/f control mode.

Note:	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0). The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. Dependency: Refer to: p9612

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: For the set stop response STOP B, in order that the OFF3 ramp is actually maintained, when just using Safety Basic functions, the following must be carefully observed:

- the transition time STOP F to STOP A (p9658, p9858) must be set longer or equal to the SS1 delay time (p9652, p9852).
- if a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119).

Description:	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Motor Module to brake along the OFF3 down ramp (p1135).		
Recommendation:	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time \geq p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time \geq p1135 + p1228

Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Description:

For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion.

For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")

For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.

Dependency:

Refer to: p9904, p9905

Note:

The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON).

Special case for Control Unit and option slot modules:

When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

Description: Displays the active sampling time of the TM54F.

In this clock cycle, the debounced F-DIs (p10017) are evaluated, and converted over to SGEs.

In this clock cycle, also the F-DOs are controlled corresponding to the presently available SGAs.

This clock cycle corresponds to the smallest communication clock cycle that was entered in p10000[].

SGEs are transferred to the drives, and the SGAs received from the drives are transferred with the specific communication clock cycle of each drive in p10000[].

The value of a specific index of p10000[] represents the communication clock cycle of the drive, which is entered in the same index of p10010[].

- if p0799[0] is less than 1 ms, then p10017 = 1 ms or a multiple integer of 1 ms.
- if p0799[0] is greater or equal to 1 ms, then p10017 must = p0799[0] - or must be a multiple integer of p0799[0].

Note: Example:
Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.
Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

Note:	If a safety function is assigned to an input (e.g. via p10022), then the following applies: - logical "0": Safety function is selected - logical "1": Safety function is de-selected The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function: With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level. This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function. With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level. This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function. F-DI: Failsafe Digital Input The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051. The parameter is only updated in the following cases: - if the Safety Extended Functions are enabled by means of activation via F-DI. - if transfer of the F-DIs via PROFIsafe is enabled (see p9501). In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

Dependency: Refer to: p10017, p10040

Note: If a safety function is assigned to an input (e.g. via p10022), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

Note:

F-DI: Failsafe Digital Input

If a safety function is assigned to an input (e.g. via p10122), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10140) of the input as either NC or NO contact and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- if the Safety Extended Functions are enabled by means of activation via F-DI.

- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).

Handling BICO technology

Binector:  Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

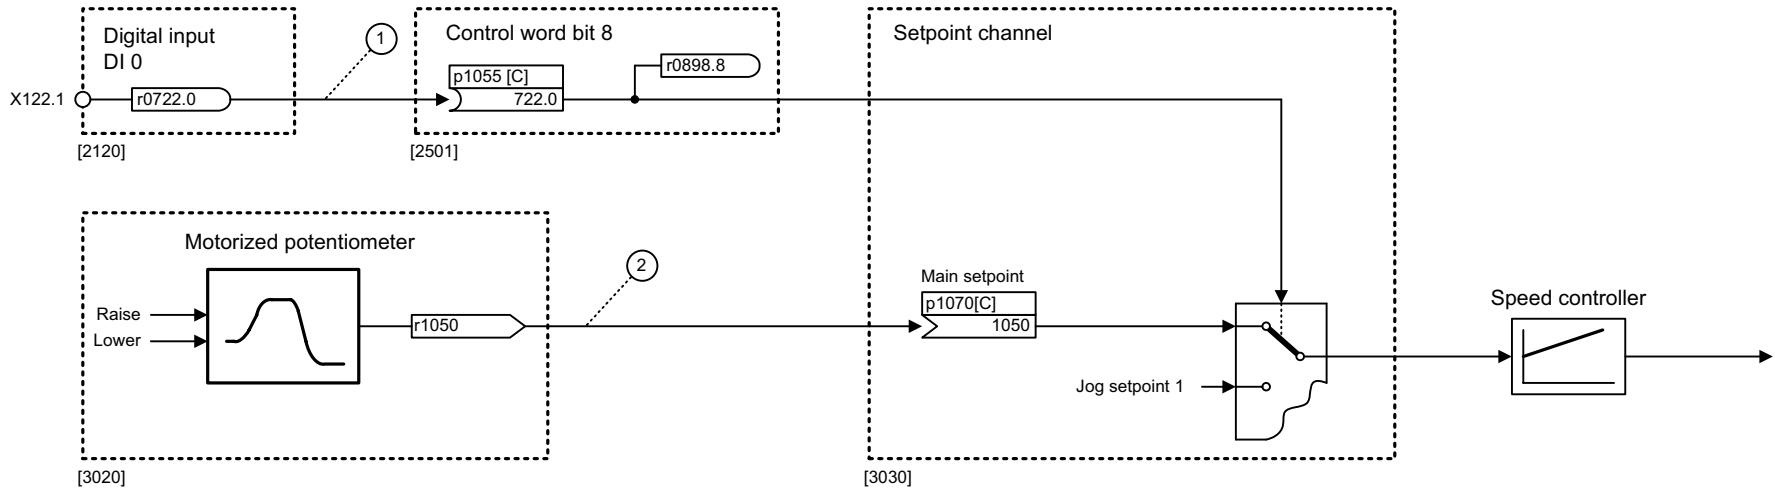

Connector:  Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:
"BI:" parameter for binectors (BI = Binector Input)
or
"CI:" parameter for connectors (CI = Connector Input)

Example:

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.

Parameterizing steps:

- ① p1055[0] = 722.0 Terminal X122.1 acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

<2> Can be used as fast measuring probe inputs (refer to [4735], [4740]).

<3> The digital output access authority is displayed in r0729.

<4> Can only be used with drive object CU_I (e.g. SIMOTION D).

Fig. 3-25 2194 – CU_CX32/CU_LINK

<1> The drive object CU_LINK only exists for automation systems with SINAMICS Integrated (e.g. SIMOTION D, SINUMERIK NCU) and the corresponding controller extension (e.g. CX32-2, NX10).
On the SINAMICS Integrated, each controller extension is represented by a drive object CU_LINK.
<2> p8800: CU_LINK address.
Address of the controller extension, represented by the drive object CU_LINK. The address correlates with the DRIVE-CLIQ socket of the Control Unit connected/configured to the controller extension configured.
Value range: See p0918 (PROFIBUS address)
The parameter p8800 is only readable through non-cyclic parameter access via DPV1 services.

<1> Depending on the drive object, only specific telegrams can be used. Not suitable for sensorless vector control.
 <2> If p0922 = 999 is changed to another value, the telegram is automatically assigned as specified in [2415] to [2423].
 If p0922 ≠ 999 is changed to p0922 = 999, the "old" telegram assignment is maintained as specified in [2415] to [2423].
 <3> The maximum number of PZD words depends on the drive object type.

<1> Depending on the drive object, only specific telegrams can be used.
 <2> If p0922 = 999 is changed to another value, the telegram is automatically assigned as specified in [2415] - [2423].
 If p0922 ≠ 999 is changed to p0922 = 999, the "old" telegram assignment is maintained as specified in [2415] - [2423]!
 <3> Freely interconnectable.
 <4> The maximum number of PZD words depends on the drive object type.
 <5> In order to comply with the PROFIdrive profile, PZD1 must be used as control word 1 (STW1) or status word 1 (ZSW1).
 p2037 = 2 should be set if STW1 is not transferred with PZD1 as specified in the PROFIdrive profile.

- <1> The number of PZD receive words depends on the drive object type.
- <2> The connector-binector converter only converts the lower 16 bits irrespective of the input variable.
- <3> The following representation applies for words: 4000 hex = 100 % for double words 4000 0000 hex = 100 %.
The reference variables p200x apply for the ongoing interconnection (100 % -> p200x).
The following applies for temperature values: 100 °C -> 100 % = 4000 hex or 4000 0000 hex; 0 °C -> 0 %.
- <4> In order to maintain the PROFdrive profile, receive word 1 must be used as control word (STW1) (due to bit 10 "control requested").
- <5> Using the connector-binector converters, the bits can be extracted from two of the PZD receive words 5 to 32 and used as binectors.
- <6> Every PZD word can be assigned a word or a double word. Only one of the 2 interconnection parameters r2050 or r2060 can have a value ≠ 0 for a PZD word.
- <7> When interconnecting a connector output multiple times all the connector inputs must have either Integer or FloatingPoint data type.

- <1> The number of PZD send words depends on the drive object type.
- <2> A PZD send word can either be supplied via connector input p2051[x] (WORD) or via p2061[x] (DWORD). The two corresponding connector inputs cannot be interconnected.
- <3> Physical word and double word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex or 4000 0000 hex in the case of double words, if the input variable has the value p200x). The following applies for temperature values: 100° C -> 100 % = 4000 hex or 4000 0000 hex; 0° C -> 0 %.
- <4> To comply with the PROFIdrive profile, send word 1 must be used as status word 1 (ZSW1), not as DWORD.

- <1> POWER ON = 24 V electronics supply OFF -> ON or RESET button.
- <2> The sequencer is implemented according to the PROFIdrive profile.
- <3> Only for SINAMICS S120 and G150:
If a DO Infeed (A_INF, B_INF and S_INF) is used, it closes the line contactor (refer to [8732][8832][8932]) and not the DO SERVO/VECTOR.
- <4> These control commands can also be triggered by a fault response.
- <5> STWA.xx = control word, sequence control, bit xx (r0898) [2501]; ZSWA.xx = status word, sequence control bit xx (r0899) [2503].
- <6> Only if "Safety Integrated" is active.
- <7> The parameters p1226, p1227 and p1228 influence this status.

- <1> Shutdown threshold of the standstill detection. In this case (e.g. when using a brake), another criterion than the speed actual value can be selected to clear the pulses. Otherwise, we recommend to keep the factory setting.
- <2> For p1276 = 300.000 s, the timer is de-activated, i.e. the timer output is always 0. Note: When operating a motor with a brake which must not be applied while the motor is rotating, the monitoring time of both timers must be set to 300 s.
- <3> For operation without brake, p1224[0...3] must be 0 (factory setting) in order to avoid undesirable interaction with the sequence control.
- <4> The internal signal comprises signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).
- <5> Only for SINAMICS S120.

<1> This pulse enable path only works for operation with brake (p1215 > 0).
 <2> For brakes with one single checkback signal, the inverted signal has to be interconnected to the BICO input for the second checkback. The switching times of the brake are set in p1216 and p1217.
 <3> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
 <4> If an external motor holding brake is used, p1215 should be set to 3 and r1229.1 should be used as control signal.
 <5> The internal signal comprises signals that lead to OFF1 or OFF3, e.g. BICO or fault response.
 <6> If the function module "extended brake control" is active (r0108.14 = 1), r1229.1 should be interconnected as control signal.
 <7> Only for SINAMICS S120 booksize.
 <8> Only for SINAMICS S120 Chassis/S150/G130/G150.
 Note: Braking signal diagnostic evaluation (p1278) is only relevant for SBC (Safe Brake Control) (controls the Safe Brake Relay). <7>

Ramp-function generator selection

Ramp-function generator tracking

Ramp-function generator status word

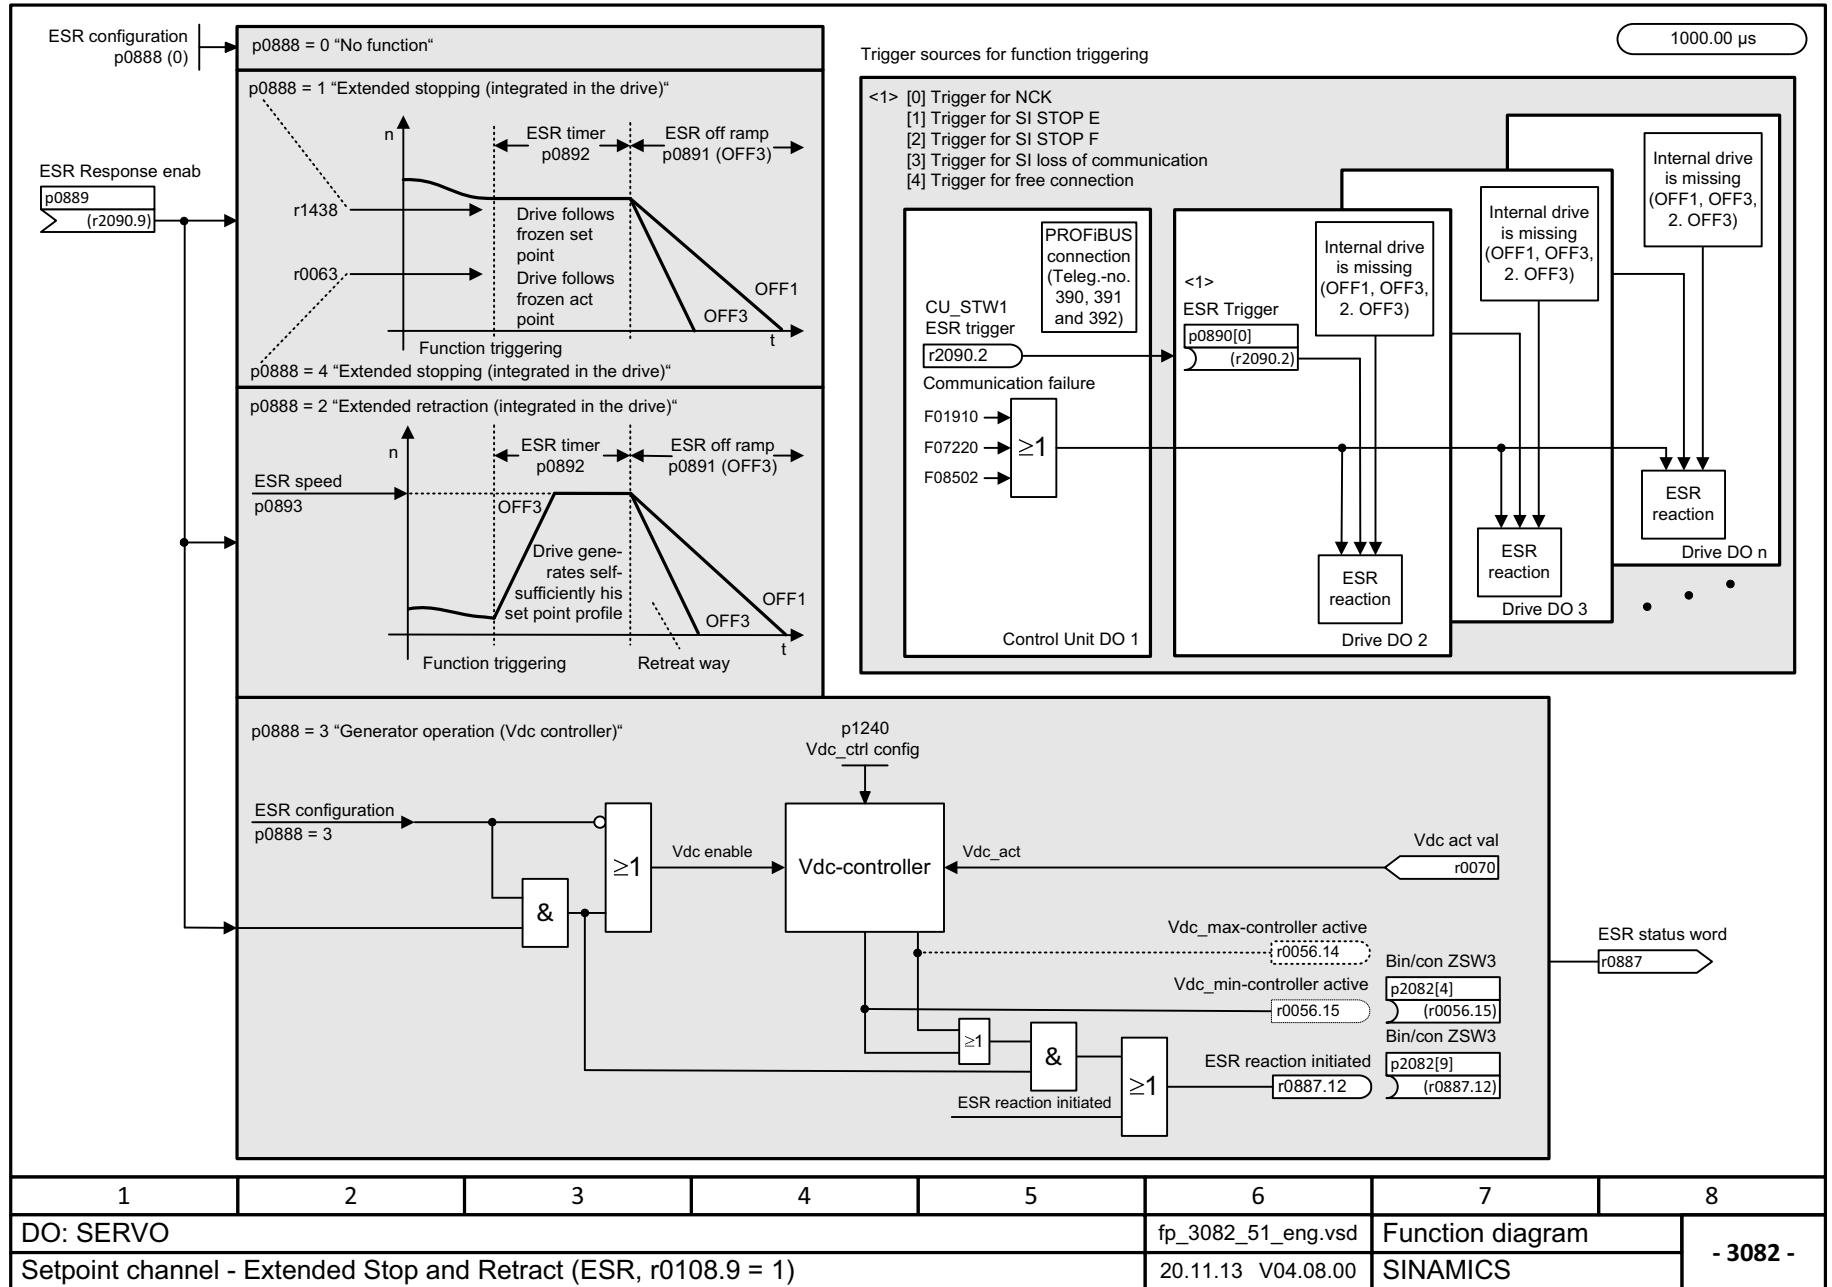

- <1> For p1145 > 0, ramp-function generator tracking is activated when the torque limiting responds. This means that the speed controller output only exceeds the torque limit by a deviation that can be set via p1145.
- <2> For OFF1/OFF3, the ramp-function generator ramp is active. The ramp-function generator is set (SERVO: to the actual value, VECTOR, VECTOR3P, VECTORGL, VECTORMV, VECTORSL: to the setpoint (r1170)) and stops the drive with the ramp-downtime (p1121 or p1135). STW1.4 (enable ramp-function generator) is effective while the drive is stopped via the ramp-function generator. Depending on the p1115, the basic ramp-function generator [3060] or the extended ramp-function generator [3070] is effective.
For SERVO is valid: When the function module "extended setpoint channel" is not active (r0108.8 = 0), for OFF1/OFF3 the down ramp of the basic ramp-function generator is effective (refer to n_set_4 on [3060.8]).
- <3> The interpolator is only active with activated "basic positioner" Function Module or with isochronous PROFIdrive mode and sign of life received by the master (STW2.12 ... STW2.15).
- <4> Behavior of the response ramp of the torque limiting:
p1145 = 0.0: No ramp-function generator tracking. The ramp-function generator ramp is no longer in the range of the speed actual value.
p1145 = 1.0: The ramp-function generator ramp remains as close as possible to the speed actual value.
p1145 > 1.0: The ramp-function generator ramp is steeper than for p1145 = 1.0 (higher "speed following error").
- <5> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).
- <6> For SERVO only.
- <7> For VECTOR, VECTOR3P, VECTORMV only.
- <8> For VECTORGL only.
- <101> To view the pre-assignment of the sampling times in p0115, refer to p0112.

- <1> Only for encoder:
p1400.10 = 1 is recommended if a torque pre-control signal is also connected at [5060] in addition to the speed pre-control signal.
- <2> The interpolator is only effective for clock-cycle synchronous PROFdrive operation and sign-of-life received from the master (STW2.12 ... STW2.15). If the Dynamic Servo Control (DSC) is active, an additional deadtime of one speed controller clock cycle is effective.
- <3> For a 1/0 edge from control command STW2.8 "travel to fixed stop" [2444] the output of all filters is set to the input value for an instantaneous response to a change of the speed setpoint sign.
- <4> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).

<1> Differential input!
In case of a ground-based input signal, the terminal X521.4 must be connected to the reference potential M.
Caution:
The voltage between an input (X521.3 or X521.4) and the ground point must not exceed 35 V.
When the load resistor is switched in (S5.1 closed), the voltage between the input terminals must not exceed 15 V.

4.1 Overview of faults and alarms

4.1.1 General information

Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET.
- Online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> • The appropriate fault reaction is initiated • Status signal ZSW1.3 is set. • The fault is entered into the fault buffer. <p>How are faults eliminated?</p> <ul style="list-style-type: none"> • Remove the original cause of the fault. • Acknowledge the fault.
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> • Status signal ZSW1.7 is set. • The alarm is entered into the alarm buffer. <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> • Alarms acknowledge themselves. <p>If the cause of the alarm is no longer present, they automatically reset themselves.</p>

Fault reactions

Note

The following table lists all fault reactions and their meanings used for the entire SINAMICS drive family.

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	<p>No reaction when a fault occurs,</p> <p>Note</p> <p>When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies:</p> <p>When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>

Section "Diagnostics"

The "List of faults and alarms" (Page 2391) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message value:

The information provided under the message value informs you about the composition of the fault/alarm value.

Example:

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces" (Page 2384). In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)
 - Specifies the "Channel error type" of the PROFINET channel diagnostics.
 - When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)
 - Specifies the bit number in date set DS1 of the diagnostic alarm for SIMATIC S7.
 - When the diagnostic alarms are activated, the texts listed in the table can be displayed.

4 Faults and alarms

4.1 Overview of faults and alarms

Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

Component

Type of hardware component that has triggered the fault or alarm.

With "Component: None" it is not possible to assign the message to a hardware component.

Propagation

In the case of faults that are, for example, triggered by the Control Unit or a Terminal Module, central functions of the drive are also often affected. Using propagation, faults that are triggered by one drive object are therefore passed on to other drive objects.

There are the following types of propagation:

- BICO

The fault is passed on to all active drive objects with closed-loop control functions (infeed, drive) to which there is a BICO interconnection.

- DRIVE

The fault is passed on to all active drive objects with closed-loop control functions.

- GLOBAL

The fault is passed on to all active drive objects.

- LOCAL

The response of this type of propagation is dependent on parameter p3116.

With binector input p3116 = 0 (factory setting) the following applies:

The fault is passed on to the first active drive object with closed-loop control functions.

With binector input p3116 = 1-signal, the following applies:

The fault is not passed on.

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note

See Table "Fault reactions" (Page 2379)

Cause:

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies:

- the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS).
- if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001).

F01340	Topology: Too many components on one line
Message value:	Component number or connection number: %1, fault cause: %2

Cause:	<p>For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.</p> <p>Fault value (r0949, interpret hexadecimal): xyy hex: x = fault cause, yy = component number or connection number.</p> <p>1yy: The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all read transfers.</p> <p>2yy: The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all write transfers.</p> <p>3yy: Cyclic communication is fully utilized.</p> <p>4yy: The DRIVE-CLiQ cycle starts before the earliest end of the application. Message value:	-		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		
Cause:	Too many DRIVE-CLiQ components were defined in the actual topology. Note: Pulse enable is withdrawn and prevented.		
Remedy:	- check the DRIVE-CLiQ wiring. - reduce the number components on the DRIVE-CLiQ line involved in order to maintain the maximum quantity structure.		

F01354	Topology: Actual topology indicates an illegal component		
Message value:	Fault cause: %1, component number: %2		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	OFF2		
Acknowledge:	IMMEDIATELY		
Cause:	The actual topology indicates at least one illegal component. Fault value (r0949, interpret hexadecimal): yyxx hex: yy = component number, xx = cause. xx = 1: Component at this Control Unit not permissible. xx = 2: Component in combination with another component not permissible. Note: Pulse enable is prevented.		
Remedy:	Remove the illegal components and restart the system.		

F01355	Topology: Actual topology changed		
Message value:	%1		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		
Cause:	The device target topology (p0099) does not correspond to the device actual topology (r0098). The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning software. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. See also: r0098 (Actual device topology), p0099 (Device target topology)		
Remedy:	One of the following counter-measures can be selected if no faults have occurred in the topology detection itself: If commissioning is still not completed: - carry out a self-commissioning routine (starting from p0009 = 1). In general: Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107). Generating servo drives: Set p0097 to 1, set p0009 to 0. Generating vector drives: Set p0097 to 2, set p0009 to 0. Generating vector drives with parallel circuit: Set p0097 to 12, set p0009 to 0. In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107).		

If commissioning has already been completed:

- re-establish the original connections and re-connect power to the Control Unit.
- restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again.
- change the device parameterization to match the connections (this is only possible using the commissioning software).

Notice:

Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning software and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

yyxx hex:

yy = connection number of the Control Unit at which the second Control Unit is connected

Note:

Remedy: - remove the DRIVE-CLiQ connection, restart the systems, install OALINK on both Control Units and commission.

Drive object: All objects
Component: None **Propagation:** BICO
Reaction: NONE

Cause: The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.
An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different.
Example 1:
BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input.
p2002: contains the reference value for current
p2001: contains the reference value for voltage
Example 2:
BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input.

Remedy:

For fault value = 1 ... 5 and 7 ... 999:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (switch-off/switch-on) for all components.

- check the EP terminal at the Motor Module (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on) for all components.

Check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.

- increase the monitoring cycle clock settings (p9500, p9511).

- "No motor holding brake available" (p1215 = 0) and "SBC" enabled (p9602 = 1).

- "Motor holding brake just like the sequence control, connection via BICO" (p1215 = 3) and "SBC" enabled (p9602 = 1).

Note:

SBC: Safe Brake Control

Remedy:

Check the parameterization of the motor holding brake and SBC and correct.

Fault value (r0949, interpret decimal):

For motion monitoring functions that are not enabled (p9601.2 = p9801.2 = 0, p9501 = 0), the following applies:

- Minimum setting for the monitoring clock cycle (in μ s).

For motion monitoring functions that are enabled (p9601.2 = p9801.2 = 1 and/or p9501 > 0), the following applies:

100:

- no matching monitoring clock cycle was able to be found.
- an illegal actual value sensing clock cycle was set for S120M (p9511).

101:

- the monitoring clock cycle is not an integer multiple of the actual value sensing clock cycle.

102:

103:

- four times the current controller sampling time (p0115[0]) is greater than the DP clock cycle when operating with an isochronous PROFIBUS.
- the DP clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

106:

108:

109:

- if the motion monitoring functions have been parameterized as encoderless (p9506), the actual value sensing clock cycle (p9511) and the current controller clock cycle (p0115[0]) must be identical.

- SINAMICS S110: if the motion monitoring functions have been parameterized as encoderless (p9506), the actual value sensing clock cycle p9511 must be = 250 µs.

110:

- the actual value sensing clock cycle (p9511) for safety with encoder (p9506 = 0) is less than 2 ms for this Control Unit (e.g. CU305).

111:

- the monitoring clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

112:

- S120M: the monitoring clock cycle cannot be maintained as a result of the conditions required in the system.

202:

- the current controller sampling time is set to zero (p0115[0]).

Remedy:

For enabled SI monitoring integrated in the drive (p9601/p9801 > 0):

- Upgrade the firmware of the Control Unit to a later version.

For enabled motion monitoring function (p9501 > 0):

- correct the monitoring clock cycle (p9500) and carry out POWER ON.

For fault value = 100:

- for S120M, set the actual value sensing clock cycle to p9511 = 0.

For fault value = 101:

- SINAMICS S120M: set the monitoring clock cycle (p9500) to an integer multiple of 2 ms.

For fault value = 104, 105:

- set a separate actual value sensing clock cycle in p9511.

- restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 µs. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.

- increase the DP clock cycle for operation with a clock-cycle synchronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.

For fault value = 107:

- set an actual value sensing clock cycle that matches the current controller clock cycle (p9511 >= 4 * p0115[0], 8 * p0115[0]) is recommended.

Note:

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.

- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).

- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 109:

- set the actual value sensing clock cycle in p9511 to the same value as the current controller clock cycle (p0115[0]).

- SINAMICS S110: set the actual value sensing clock cycle to p9511 = 250 µs.

For fault value = 200, 201:

- increase the current controller sampling time (p0115[0]).
- if required, reduce the number of components connected to the corresponding DRIVE-CLiQ line, or distribute the components across several DRIVE-CLiQ sockets.

For fault value = 202:

- set the current controller sampling time to a sensible value (p0115[0]).

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.
- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).
- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 111:

- set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller (p0115[0]).

For fault value = 112:

- set the actual value sensing clock cycle p9511 to the required value (not equal to zero).

For fault value = 202:

- set the current controller sampling time to a sensible value (p0115[0]).

Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	None Propagation: DRIVE
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	In p9700, the value 87 or 208 is saved or was entered offline. This is the reason that when booting, an attempt is made to copy Safety Integrated parameters from monitoring channel 1 to monitoring channel 2. However, no safety-relevant function has been selected in monitoring channel 1 (p9501 = 0, p9601 = 0). Copying was rejected for safety reasons. As a consequence, inconsistent parameterization can occur in both monitoring channels, which in turn results in additional error messages. Especially for inconsistent enabling of the safety functions on both monitoring channels (p9601 = 0, p9801 <> 0), fault F30625 is output. Note: This fault does not result in a safety stop response. SI: Safety Integrated See also: p9700 (SI Motion copy function)
Remedy:	- set p9700 to 0. - check p9501 and p9601 and if required, correct. - restart the copying function by entering the corresponding value into p9700. Alternatively, using the STARTER commissioning tool, perform the following steps in the online mode: - call the "Safety Integrated" screen form (the field "Select safety functions" is at "No Safety Integrated"). - click on "Change settings". - click on "Activate settings" (as a consequence, Safety Integrated is inhibited on both monitoring channels). - save all parameters (p0977 = 1 or "copy RAM to ROM"). - carry out a POWER ON (switch-off/switch-on) for all components.

Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	During booting, the system detected that the "Firmware update automatic" function (p7826 = 1) was not activated. This function must be activated for automatic firmware updates/downgrades to prevent impermissible version combinations when safety functions are enabled. Note: This fault does not result in a safety stop response. See also: p7826 (Firmware update automatic)
Remedy:	When safety functions are enabled (p9501 <> 0 and/or p9601 <> 0): 1. Activate the "Firmware update automatic" function (p7826 = 1). 2. Backup the parameters (p0977 = 1) and carry out a POWER ON. When deactivating the safety functions (p9501 = 0, p9601 = 0), the fault can be acknowledged after exiting the safety commissioning mode.

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

- 1: No encoder was parameterized for Safety Integrated.
- 2: An encoder was parameterized for Safety Integrated that does not have an A/B track (sine/cosine).
- 3: The encoder data set selected for Safety Integrated is still not valid.
- 4: A communication error with the encoder has occurred.
- 5: Number of relevant bits in the encoder coarse position invalid.
- 6: DRIVE-CLiQ encoder configuration invalid.
- 7: Non-safety relevant component of the encoder coarse position for the linear DRIVE-CLiQ encoder not valid.
- 8: Parameterized Safety comparison algorithm not supported.
- 9: Relationship between the grid division and measuring step for linear DRIVE-CLiQ encoder is not binary.
- 10: For an encoder used for Safety Integrated, not all of the Drive Data Sets (DDS) are assigned to the same Encoder Data Set (EDS) (p0187 ... p0189).
- 11: The zero point setting of a linear DRIVE-CLiQ encoder used in Safety Integrated is not zero.
- 12: The second encoder is not parameterized (p9526 = 1 is not permissible).
- 13: Hydraulic Module: A second encoder has not been parameterized and a DRIVE-CLiQ encoder is not being used.
- 14: SCSE encoder is used in conjunction with an HTL/TTL encoder, another SCSE encoder or in a 1-encoder system.

Remedy:

For fault value = 1, 2:

- use and parameterize an encoder that Safety Integrated supports (encoder with track A/B sine-wave, p0404.4 = 1).

For fault value = 3:

- check whether the drive or drive commissioning function is active and if required, exit this (p0009 = p00010 = 0), save the parameters (p0971 = 1) and carry out a POWER ON

For fault value = 4:

- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Sensor Module involved and if required, carry out a diagnostics routine for the faults identified.

For fault value = 5:

- p9525 = 0 (not permissible). Check the encoder parameterization on the Sensor Modules involved.

For fault value = 6:

- check p9515.0 (for DRIVE-CLiQ encoders, the following applies: p9515.0 = 1). Check the encoder parameterization on the Sensor Modules involved.

For fault value = 7:

For fault value = 8:

- check p9541. Use and parameterize an encoder that implements an algorithm supported by Safety Integrated.

Cause:	At least one enabled "Safety Cam" (SCA) is parameterized in p9536 or p9537 too close to the tolerance range around the modulo position. C01711	SI Motion P1 (CU): Defect in a monitoring channel
Message value:	%1
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	None Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible. If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output. The message value that resulted in a STOP F is displayed in r9725. If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK, with the exception of the following message values, which can only occur in SINAMICS: 1007: communication error with the PLC (sign-of-life). 1008: communication error with the PLC (CRC). The following described message values involve the crosswise data comparison between the two monitoring channels (safety functions integrated in the drive). The message values may also occur in the following cases if the cause that is explicitly mentioned does not apply: - cycle times not uniformly parameterized (p9500/p9300 and p9511/p9311) - differently parameterized axis types (p9502/p9302). - excessively fast cycle times (p9500/p9300, p9511/p9311). - For message values 3, 44 ... 57, 232 and 1-encoder system, differently set encoder parameters. - For message values 3, 44 ... 57, 232 and 2-encoder system, encoder parameters that have not been correctly set. - incorrect synchronization.

Message value (r9749, interpret decimal):

0 to 999: Number of the cross-compared data that resulted in this fault.

Message values that are not subsequently listed are only for internal Siemens troubleshooting.

44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

For these message values, the failsafe control signals (failsafe values) are transferred to the safety functions.

5012: Error when initializing the PROFIsafe driver.

5013: The result of the initialization is different for the two controllers.

5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (failsafe values) are transferred to the safety functions. If "Stop B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the failsafe value is delayed.

The significance of the individual message values is described in safety fault F01611.

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

Remedy:

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).

For message value = 3:

Commissioning phase:

- check the encoder parameters, and if required, correct (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).

In operation:

- check the mechanical design and the encoder signals.

- if closed-loop control with edge modulation is parameterized (p1802[x] = 9): parameterize edge modulation for actual value sensing without encoder (p9507.5 = p9307.5 = 1).

For message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.

For message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

For message value = 232:

- increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

For message value = 1 ... 999:

- if the message value is listed under cause: Check the crosswise-compared parameters to which the message value refers.
- copy the safety parameters.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version ≥ 4.7 , the CDC list is increased when setting $p9567 > 0$. For a non-compatible version of SINUMERIK this can lead to an error for the crosswise data comparison (is indicated with message value ≥ 237). If necessary, $p9567$ must be set = 0, or the firmware version of SINUMERIK upgraded.

For message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- increase the tolerance for the actual value comparison when referencing ($p9544$).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- for safe motion monitoring functions without encoder: check the conditions for pulse enable.

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

Remedy:

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for HM: C30711).

For message value = 3:

Commissioning phase:

- check the encoder parameters, and if required, correct (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).

In operation:

- check the mechanical design and the encoder signals.

For message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with HM: C30711), the monitoring clock cycle settings must be increased.

For message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

For message value = 232:

- increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

For message value = 1 ... 999:

- if the message value is listed under cause: Check the crosswise-compared parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade the Hydraulic Module software.

- upgrade the Control Unit software.

- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version ≥ 4.7 , the CDC list is increased when setting p9567 > 0 . For a non-compatible version of SINUMERIK this can lead to an error for the crosswise data comparison (is indicated with message value ≥ 237). If necessary, p9567 must be set = 0, or the firmware version of SINUMERIK upgraded.

For message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade the Hydraulic Module software.

- upgrade the Control Unit software.

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- increase the tolerance for the actual value comparison when referencing (p9544).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005: deselect checking the conditions for STO.

For message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

For message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

For message value = 1011:

- for diagnostics, refer to parameter (r9571).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

C01770	SI Motion P1 (CU): Discrepancy error of the fail-safe inputs/outputs
Message value:	%1
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Control Unit (CU) Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The fail-safe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002 / p10102. Fault value (r0949, interpret bitwise binary): yyyyxxxx bin xxxx: Discrepancy error for fail-safe digital inputs (F-DI). Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... yyyy: Discrepancy error for fail-safe digital outputs (F-DO). Bit 0: Discrepancy error for F-DO 0 ... Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.
Remedy:	- check the wiring of the F-DI (contact problems). Note: This message can be acknowledged via F-DI or PROFIsafe (safe acknowledgment). Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10006, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally. When the "Extended message acknowledgment" function (p9507.0) is active, the following applies: If the F-DI assigned for STO or SS1 is in a fail-safe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.

If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked:

- $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time)
- $p10002 \geq p9500$ (discrepancy time must be no less than p9500)
- $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply)

td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI monitoring cycle (see p9500).

tp = period for a switching operation in ms.

When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.

If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.

- $p10002 < p10017 + 1 \text{ ms} - td$
- $p10002 > td$
- $p10002 \geq p9500$

Example:

For a 12 ms SI monitoring cycle and a switching frequency of 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows:

$$p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$$

Rounded-off, p10002 ≤ 36 ms is obtained (since the discrepancy time can only be accepted as a whole SI monitoring cycle, the value will need to be rounded up or down to a whole SI monitoring cycle if the result is not an exact multiple of an SI monitoring cycle).

Fault value (r0949, interpret hexadecimal):

RRRVWXYZ hex:

R: Reserved.

V: Actual state of the DO channel concerned (see X) on processor 1 (corresponds to the states read back from the hardware, bit 0 = DO 0, bit 1 = DO 1, etc.).

Example:

Fault F01773 (P1) is signaled with fault value = 0001_0127 and fault F30773 (P2) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

A01794 (N)	SI Motion: check modulo value for safe position via PROFIsafe
Message value:	-
Message class:	Hardware/software error (1)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Control Unit (CU) Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	When parameterizing the modulo value for safe position via PROFIsafe (p9505) the position actual value can jump when the range that can be represented overflows. Range that can be represented: - 32-bit value: +/- 2048 revolutions - 16-bit value: +/- 2048 revolutions (depending on p9574)
Remedy:	Correct the parameter assignment. Set p9505 to 2^n revolutions - and to complete revolutions (i.e. a multiple of 360°). Note: This alarm can be hidden for the case that the possible position actual value jump can be tolerated for the particular application, or does not represent a problem; for example because the parameterized modulo range fits "almost as integer number" in the range of +/- 2048 revolutions that can be represented. To re-parameterize the alarm to "NO REPORT", it is not permissible that the alarm is present. As a consequence, the following sequence is required for the re-parameterization: - correct p9505 to " 2^n ". - re-parameterize the alarm using p2118 and p2119. - set p9505 back to the required value.

Cause:	After exiting safe pulse cancellation, within the wait time of 5 seconds, encoderless actual value sensing was not able to be activated for the extended functions without selection. A change is again made into the "safe pulse cancellation" state.
Remedy:	- check missing enable signals, which prevent the drive control from being commissioned (r0046). - evaluate possible fault messages of the encoderless actual value sensing and remove.

Cause:	The drive waits for communication to be established to execute the safety-relevant motion monitoring functions. Note: STO is active in this state. Alarm value (r2124, interpret decimal): 1: Wait for communication to be established to SINUMERIK. 2: Wait for communication to be established to TM54F. 3: Wait for communication to be established to PROFIsafe F-Host.

4 Faults and alarms

4.2 List of faults and alarms

Remedy: If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made as appropriate:

For communication with SINUMERIK, the following applies:

- check any other PROFIBUS messages/signals present and remove their cause.
- check that assignment of the axes on the higher-level control to the drives in the drive unit is correct.
- check enable signal of the safety-relevant motion monitoring functions for the corresponding axis on the higher-level control and if required, set it.

For communication with TM54F, the following applies:

- check any other messages/signals present for DRIVE-CLiQ communication with the TM54F and remove their cause.
- check the setting of p10010. All the drive objects controlled by the TM54F must be listed.

For communication with PROFI-safe F-Host, the following applies:

- check any other PROFI-safe communication messages/signals present and evaluate them.
- check the operating state of the F-Host.
- check the communication connection to the F Host.
- check the communication connection to the Motor Module/Hydraulic Module. It must be ensured that when the Control Unit powers up, the Motor Module/Hydraulic Module is connected and at the latest is also switched-on with the Control Unit. Otherwise, if the Motor Module/Hydraulic Module is subsequently inserted or switched on, a POWER ON must be performed at the Control Unit.

Drive object:

Component:

Power Module

Propagation:

GLOBAL

Reaction:

OFF2 (OFF1)

Acknowledge:

IMMEDIATELY

Cause:

After the line contactor closes the power unit does not signal the READY state within the monitoring time (p0857).

The end of the DC link precharging was not able to be completed for one of the following reasons:

- 1) There is no line supply voltage connected.
- 2) The line contactor/line side switch has not been closed.
- 3) The line supply voltage is too low.
- 4) Line supply voltage incorrectly set (p0210).
- 5) The precharging resistors are overheated as there were too many precharging operations per time unit.
- 6) The precharging resistors are overheated as the DC link capacitance is too high.
- 7) The precharging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link.
- 8) The precharging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.
- 9) The DC link has either a ground fault or a short-circuit.
- 10) The precharging circuit is possibly defective (only for chassis units).

See also: p0210 (Drive unit line supply voltage), p0857 (Power unit monitoring time)

Remedy:

In general:

- check the line supply voltage at the connecting terminals.
 - check the line supply voltage setting (p0210).
 - check the monitoring time and, if required, increase (p0857).
 - where relevant, observe additional power unit messages/signals (e.g. F30027).
 - the following applies to booksize units: Wait (approx. 8 min.) until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.
- For 5):
- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).
- For 6):
- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC link capacitance if necessary (refer to the appropriate Equipment Manual)
- For 7):
- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link

For 8):

- check the connections of the external line contactor. The line contactor must be open during DC link fast discharge.

For 9):

- check the DC link for ground faults or short circuits.

The availability of the Smart Mode function is displayed in r0192. - for A_INF the following applies: deactivate the Smart Mode using $p3400.0 = 0$, and activate closed-loop voltage control with $p3400.3 = 1$. For booksize power units, it must be noted that for a supply voltage $p0210 > 415 \text{ V}$ only the Smart Mode is possible in the presetting. If DC link voltages above 660 V are permissible in the application, then voltage-controlled operation can be activated with p0280, p0210, p3400 and p3510. A06250 (F, N) Infeed: Defective capacitor(s) in at least one phase of line filter

Message value: %1

Message class: Line filter faulted (15)

Drive object: A_INF, R_INF, S_INF

Component: Power Module **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: A change in the line filter capacitance was detected in at least one line phase.
The voltages and phase currents of the line filter, measured using a VSM, indicate a deviation of the filter capacitances from the value parameterized in p0221.
A change or a defect of the line filter capacitors results in a shift of the resonant frequencies and can result in severe damage to the drive system.
Alarm value (r2124, floating point):
The currently calculated capacitance in μF (rounded-off to an integer number).
Note:
The first decimal point specifies the number of the phase (1, 2, 3) where the capacitance deviates from the specified value.

Remedy:

- check the parameterized value of the filter capacitance (p0221).
- check the correct wiring of the VSM:
Differential voltages u12 and u23 must be available at the 100 V/690 V inputs of the VSM.
The phase currents of the line filter must be available at the 10 V inputs via a current-voltage transformer.
- check the alarm limits for the permissible filter capacitance deviation (p3676).
- check the scaling of the line supply voltage measurement using the VSM (p3660).
- check the scaling of the filter current measurement using the VSM (p3670).
- check the line filter capacitors and if required, replace the line filter.

For a parallel connection of power units, the following applies:

- parameter r3677[0...2] indicates the average value of all filter capacitances.
- parameters r7320[0...n], r7321[0...n] and r7322[0...n] indicate the capacitance of each individual filter. The defective filter can be localized by the particular VSM.

Drive object: A_INF, R_INF, S_INF
Component: Power Module **Propagation:** GLOBAL
Reaction: NONE

Cause: After an OFF1 = 1 no valid current offset measurement was able to be made within the monitoring time (p3491) before closing the line contactor. The current offset is set to 0.

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: NONE

Cause: When one button tuning is activated (p5300 = 1), the current controller is measured after the pulses have been enabled. Evaluation has indicated that the current control loop was not appropriately set.
 Possible causes:
 - incorrectly set current controller.
 - PRBS amplitude set too high (p5296).
 Alarm value (r2124, interpret hexadecimal):
 1: Dynamic response too low.
 2: Current controller unstable.
 Note:

A07092	Drive: moment of inertia estimator still not ready
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Control Unit (CU) Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	The moment of inertia estimator has still not determined any valid values. The acceleration cannot be calculated. The moment of inertia estimator has stabilized, if the frictional values (p1563, p1564) as well as the moment of inertia value (p1493) have been determined and the appropriate status signal is set (r1407.26 = 1). The following parameters influence the response of the moment of the inertia estimator: p1560, p1561, p1562
Remedy:	Traverse the axis until the moment of inertia estimator has stabilized. This alarm is automatically withdrawn after the moment of inertia estimator has stabilized.

F07093 (A)	Drive: Test signal error
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Component:	Control Unit (CU) Propagation: GLOBAL
Reaction:	OFF3 (NONE, OFF1, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	An error was identified when executing the "Test signal" function (p5307.1 = 1). The function was not executed or was canceled. Fault value (r0949, interpret decimal): 1: No distance limit has been defined (p5308 = 0). 2: The moment of inertia estimator has not stabilized in the parameterized time (p5309) (r1407.26). 3: The parameterized distance (p5308) was exceeded. 4: no motor encoder parameterized (closed-loop speed control without encoder). 5: Offset (p5297) is too high for the parameterized distance (p5308). 6: Pulse enable was withdrawn while traversing. See also: p5307 (Test signal activation), p5308 (Test signal traversing range limiting), p5309 (Test signal duration)
Remedy:	For fault value = 1: - Define distance limiting (p5308). For fault value = 2: - increase the duration or distance limiting (p5309, p5308). For fault value = 3: - check distance limiting (p5308). For fault value = 4: - configure speed control with encoder. For fault value = 5: - increase distance limit p5308 or reduce offset p5297. - the fault can only be acknowledged after p5300 was set = 0. - for the factory setting, a test signal duration of approximately 1.3 s is obtained. If an offset (p5297) of 60 rpm is set, for example, then this results in a distance of approximately 1.3 revolutions. As a consequence, a value must be parameterized in parameter p5308, which is longer than this distance + 10% controller reserve (e.g. p5308=515°). Further, the distance depends on the speed controller sampling time (p0115[1] and the controller configuration (p5271). For fault value = 6: - keep the drive switched on until the "Test signal" function has been completely exited.

Cause:	A function of the function module "extended torque control" (r0108.1) was activated - however the (complete) function is not available. Alarm value (r2124, interpret decimal): 1 ... 3: The kT estimator is active (p1780.3 = 1) without a functioning compensation of the voltage emulation error in the drive converter. This means that the accuracy is severely restricted. 1: The drive converter voltage emulation error "final value" is 0 (p1952). 2: The drive converter voltage emulation error "current offset" is 0 (p1953). 3: The compensation of the voltage emulation error is disabled (p1780.8 = 0). 4: The kT estimator (p1780.3 = 1), the kT(iq) characteristic (p1780.9 = 1) or the compensation of the voltage emulation error (p1780.8 = 1) was activated without activating the function module "extended torque control" (when the function module is activated, the following must apply: r0108.1 = 1). 5: the kT(iq) characteristic has been activated (p1780.9 = 1). Remedy:	Not necessary. This alarm automatically disappears after the upper threshold has been distinctly undershot. Message class:	Application/technological function faulted (17)		
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE

Cause:	The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282). The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds. When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value. Remedy:	If the controller is not to intervene: - increase the ramp-down times. - switch off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control). If the ramp-down times are not to be changed: - use a chopper or regenerative feedback unit.

F07412 Drive: Commutation angle incorrect (motor model)

Message value: %1

Message class: Actual position/speed value incorrect or not available (11)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: ENCODER (NONE, OFF2)

Acknowledge: IMMEDIATELY

Cause: An incorrect commutation angle was detected that can result in a positive coupling in the speed controller.

Possible causes:

- the phase sequence of the output phases for the motor is incorrect (e.g. the phases are interchanged).
- the motor encoder is incorrectly adjusted with respect to the magnet position.
- the motor encoder is damaged.
- the angular commutation offset is incorrectly set (p0431).
- data to calculate the motor model has been incorrectly set (p0356 (motor-stator leakage inductance) and/or p0350 (motor-stator resistance) and/or p0352 (cable resistance)).
- the changeover speed for the motor model is too low (p1752). The monitoring function only becomes effective above the changeover speed.
- pole position identification might have calculated an incorrect value when activated (p1982 = 1).
- the motor encoder speed signal is faulted.
- the control loop is instable due to incorrect parameterization.

Fault value (r0949, interpret decimal):

SERVO:

0: The comparison of the pole position angle from the encoder and motor model resulted in an excessively high value (> 80 ° electrical).

1: -

VECTOR:

0: The comparison of the pole position angle from the encoder and motor model resulted in an excessively high value (> 45 ° electrical).

1: The change in the speed signal from the motor encoder has changed by > p0492 within a current controller clock cycle.

- Remedy:**
- check the phase sequence for the motor, and if required, correct (wiring, p1820).
 - if the encoder mounting was changed - re-adjust the encoder.
 - replace the defective motor encoder.
 - correctly set the angular commutation offset (p0431). If required, determine using p1990.
 - correctly set the motor stator resistance, cable resistance and motor-stator leakage inductance (p0350, p0352, p0356).
- Calculate the cable resistance from the cross-section and length, check the inductance and stator resistance using the motor data sheet, measure the stator resistance, e.g. using a multimeter - and if required, again identify the values using the stationary motor data identification (p1910).
- increase the changeover speed for the motor model (p1752). The monitoring is completely deactivated for p1752 > p1082 (maximum speed).
 - with pole position identification activated (p1982 = 1) check the procedure for pole position identification (p1980) and force a new pole position identification procedure by means of de-selection followed by selection (p1982 = 0 -> 1).

Note:

For High Dynamic Motors (1FK7xxx-7xxx), for applications with a higher current, if necessary, the monitoring should be disabled.

For VECTOR, within the encoder adjustment (p1990 = 2): - a difference of > 6 ° electrical to the encoder angle was determined.
Remedy:	- correctly set the angular commutation offset (p0431). - re-adjust the motor encoder after the encoder has been replaced. - replace the defective motor encoder. - check the pole position identification routine. Component:	None Propagation: GLOBAL
Reaction:	ENCODER (NONE, OFF2)

Cause:	The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2). Cause 1: - the encoder was replaced. Cause 2: - a third-party, built-in or linear motor was re-commissioned. Cause 3: - the motor with integrated and adjusted encoder was replaced. Cause 4: - the firmware was updated to a version that checks the encoder serial number. Note: With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2). When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1). Proceed as follows to hide serial number monitoring: - set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0. - parameterize F07414 as message type N (p2118, p2119).
Remedy:	For causes 1, 2: Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed. SERVO: If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated. or Set the adjustment via p0431. F07417	Drive: Pulse technique not plausible (motor model)		
Message value:	%1		
Message class:	Application/technological function faulted (17)		
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF2 (NONE)		
Acknowledge:	IMMEDIATELY		
Cause:	The evaluation of the test pulse response indicated incorrect values. Fault value (r0949, interpret decimal): 0: An impermissible pulse technique configuration was detected during ramp-up. Possible causes: - the pulse technique was initially selected when the system powered up (p1750.5 = 1) but the power unit component does not support the current oversampling required (see r0192.23). As a consequence, p1750.0 was de-selected automatically. 10: The pulse response is repeatedly implausible. Possible causes: - incorrect configuration of the power unit component - the power unit component is faulty. 20: For the specified pulse amplitude, the measured pulse response is much higher than the expected value. Possible causes: - Strong oscillations have occurred. - the motor is short-circuited for high frequencies (output filter). - the motor is damaged.		
Remedy:	For fault value = 0: Once the pulse technique has been de-selected automatically (p1750.5 = 0), there are two possible options: - acknowledge the fault and save parameter p1750.5 = 0 -> field-oriented control mode to standstill is not used and replaced by transition to open-loop control at low speeds. - upgrade the power unit firmware (at least V4.3) -> field-oriented control mode to standstill is available. For fault value = 10: With active selection of the pulse technique (p1750.5 = 1): - POWER ON (switch-off/switch-on) the Control Unit and the power unit together again. or - carry out a manual warm restart (p0009 = 30, p0976 = 2, 3). If this does not solve the problem: Replace the power unit component. For fault value = 20: - control parameters might have been adjusted (factory setting, commissioning). - filters must not be connected between motor and converter/inverter. - check the motor.

Fault value (r0949, interpret binary): Bit 0: a filter has still not been assigned (p5281). Bit 1: the assigned filter belongs to the "Extended current setpoint filter" function module that has not been activated (r0108.21). Remedy:	The message can always be removed by deactivating adaptation (p5280 = 0, -1). F07432	Drive: Motor without overvoltage protection
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Component:	None Propagation: GLOBAL
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY
Cause:	In the case of a fault at maximum speed, the motor can generate an overvoltage that can destroy the drive system. Fault value (r0949, interpret hexadecimal): Associated Drive Data Set (DDS).

Remedy:

Overvoltage protection can be implemented in the following ways:

1. Limit the maximum speed (p1082) without any additional protection.

The maximum speed without protection is calculated as follows:

Rotary synchronous motors: $p1082 \text{ [rpm]} \leq 11.695 * r0297/p0316 \text{ [Nm/A]}$

Linear motors: $p1082 \text{ [m/min]} \leq 73.484 * r0297/p0316 \text{ [N/A]}$

Rotary synchronous motor connected to the high-frequency converter:

$p1082 \text{ [rpm]} \leq 4.33165E9 * (-p0316 + \text{root}(p0316^2 + 4.86E-9 * (r0297 * r0313)^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})) / (r0297 * r0313^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})$

Linear motor connected to the high-frequency converter:

$p1082 \text{ [m/min]} \leq 689.403 * p0315 * (\text{root}(p0316^2 * p0315^2 + 0.191865 * r0297^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})) / (r0297 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})$

Rotary induction motor connected to the high-frequency converter:

$p1082 \text{ [rpm]} \leq \text{maximum}(2.11383E5 / (r0313 * \text{root}((r0377 \text{ [mH]} + r0382 \text{ [mH]}) * p0234 \text{ [\mu F]})); 0.6364 * r0297 * p0311 \text{ [rpm]} / p0304)$

2. Use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801 – only for synchronous motors).

When using a synchronous motor with VPM at the high-frequency converter, the following must apply:

$p1082 \text{ [rpm]} \leq p0348 * (r0377 + p0233) / p0233$

When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" (STO) must be connected to the VPM.

When using a VPM, p0643 must be set to 1.

3. Activate the internal voltage protection (p1231 = 3, only for synchronous motors).

In so doing, the following hardware preconditions must be fulfilled:

- the infeed of the group must be capable of energy recovery (Active Line Module, Smart Line Module), and the energy recovery power of the infeed must not be less than the maximum utilized S1 power of the synchronous motor.
- For Control Unit and infeed, a 24 V power supply other than that for the Motor Module must be used with the voltage protection activated. The 24 V power supply of this Motor Module must be DC link buffered (e.g. CSM).
- a Braking Module with a correspondingly configured braking resistor must be available at the DC link.
- the synchronous motor must be short-circuit proof.

Cause:

The changeover to closed-loop control with encoder is not possible as the encoder has not been unparked.

Remedy:

- check whether the encoder firmware supports the "parking" function (r0481.6 = 1).
- upgrade the firmware.

Note:

For long-stator motors (p3870.0 = 1), the following applies:

The encoder must have completed the unparking procedure (r3875.0 = 1) before a changeover can be made to closed-loop control with encoder. The encoder is unparked using binector input p3876 = 0/1 signal and remains until a 0 signal in this state.

Message class: Application/technological function faulted (17)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: OFF2

Cause: A drive data set was selected - with the pulses enabled - which has a different parameterized direction of rotation (p1821).
It is only possible to change the motor direction of rotation using p1821 when the pulses are inhibited.

Remedy:

- change over the drive data set with the pulses inhibited.
- ensure that the changeover to a drive data set does not result in the motor direction of rotation being changed (i.e. for these drive data sets, the same value must be in p1821).

F07435 (N) Drive: Setting the ramp-function generator for sensorless vector control

Message value: Parameter: %1

Message class: Application/technological function faulted (17)

Component: None **Propagation:** GLOBAL

Reaction: Vector: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3)
Hla: OFF2 (NONE, OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141) or bypassed (p1122). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen or was not able to be realized.
The drive is switched-on with flying restart activated (p1200), and at the same time the ramp-function generator is bypassed (p1122).

Remedy:

- deactivate the holding command for the ramp-function generator (p1141).
- do not bypass the ramp-function generator (p1122).
- suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).

Note:
For sensorless vector control it is not practical to read in the main setpoint of the speed control via p1155 or p1160 (p0922). In this case, the main setpoint should be injected before the ramp-function generator (p1070). The reason for this is that the ramp-function generator output is automatically set when transitioning from closed-loop speed controlled into open-loop speed controlled operation.
